1 The Basic Oxygen steel-making process is a method of preparing steel from carbon-rich molten pig iron. The process is basic because chemical bases are added to remove impurities. One such impurity is phosphorus pentoxide, $\mathrm{P}_{4} \mathrm{O}_{10}$. Calcium oxide, CaO , is added to remove it and the only product of the reaction is the salt, calcium phosphate, $\mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$.

How many moles of CaO reacted with one mole of $\mathrm{P}_{4} \mathrm{O}_{10}$ in this reaction?
A 1
B 1.5
C 3
D 6

2 Two moles of an oxidising agent, $\mathrm{XO}_{4}^{-}$in the presence of excess acid oxidised $96 \mathrm{dm}^{3}$ of nitrogen dioxide gas at room temperature and pressure to $\mathrm{NO}_{3}{ }^{-}$.

What is the number of moles of electrons accepted by one mole of $\mathrm{XO}_{4}{ }^{-}$?
A 1
B 2
C 3
D 4

3 Use of the Data Booklet is relevant to this question.
The ion $\mathbf{T}^{+}$contains 28 electrons and 35 neutrons.
Which of the following statements about $\mathbf{T}^{+}$or $\mathbf{T}$ is correct?
A T and $\mathrm{Ga}^{3+}$ are isoelectronic species.
B The elemental form of $\mathbf{T}$ can be oxidised by chlorine.
C The electronic configuration of $\mathbf{T}^{+}$ion is $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 3 d^{9} 4 s^{1}$.
D The angle of deflection of ${ }^{27} \mathrm{~A} \mathrm{l}^{3+}$ is approximately three times that of $\mathbf{T}^{+}$in an electric field.

4 Which of the following species has a different bond angle from the rest?
A $\mathrm{ICl}_{3}$
B $\quad \mathrm{SF}_{3}{ }^{+}$
C $\mathrm{ClO}_{3}-$
D $\mathrm{N}_{2} \mathrm{H}_{4}$

5 What will happen to the volume of a bubble of air submerged in water under a lake at $10.0^{\circ} \mathrm{C}$ and 2.00 atm if it rises to the surface where the temperature is $20.0^{\circ} \mathrm{C}$ and the pressure is 1.00 atm ?

A The volume will increase by a factor of 2.00.
B The volume will increase by a factor of 2.07 .
C The volume will decrease by a factor of 2.00 .
D The volume will decrease by a factor of 1.93 .

6 The graph below shows the variation in the standard enthalpy change of fusion, $\Delta H^{\ominus}$ fus for 8 consecutive elements from period 2 to 3 in the periodic table.

Standard enthalpy change of fusion is the heat absorbed when one mole of a substance changes its state from solid to liquid under standard conditions.

Which of the following statements is true based on the information deduced from the above graph?

A The chlorides become more acidic from $\mathbf{A}$ to $\mathbf{C}$.
B An oxide of $\mathbf{E}$ dissolves in water to form an alkaline solution.
C Element $\mathbf{G}$ has a higher first ionisation energy than element $\mathbf{F}$ and $\mathbf{H}$.
D Element D has a lower electrical conductivity as compared to element $\mathbf{F}$.

7 Some enthalpy changes of combustion are given below.

|  | $\Delta H_{c} / \mathrm{kJ} \mathrm{mol}^{-1}$ |
| :---: | :---: |
| $\mathrm{CO}(\mathrm{g})$ | -283 |
| $\mathrm{H}_{2}(\mathrm{~g})$ | -286 |
| $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})$ | -715 |

What is the enthalpy change of the following reaction, in $\mathrm{kJ} \mathrm{mol}^{-1}$ ?

A -146
B +146
C $\quad-140$
D $\quad+140$

8 The reaction of nitrogen monoxide and hydrogen gas

$$
2 \mathrm{NO}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow \mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

is thought to involve the following steps:

| I | $\mathrm{NO}+\mathrm{NO} \rightleftharpoons \mathrm{N}_{2} \mathrm{O}_{2}$ | (fast) |
| :--- | :--- | :--- |
| II | $\mathrm{N}_{2} \mathrm{O}_{2}+\mathrm{H}_{2} \longrightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{N}_{2} \mathrm{O}$ | (slow) <br> III $\mathrm{N}_{2} \mathrm{O}+\mathrm{H}_{2} \longrightarrow \mathrm{~N}_{2}+\mathrm{H}_{2} \mathrm{O}$ |
| (fast) |  |  |

Which of the following about the reaction is true?
A $\mathrm{H}_{2}$ acts as the catalyst.
B The rate equation for the reaction is rate $=k\left[\mathrm{~N}_{2} \mathrm{O}_{2}\right]\left[\mathrm{H}_{2}\right]$.
C The overall order of the reaction is 3 .
D Increasing the concentration of NO does not change the rate of reaction.

9 Hydrogen peroxide reacts with acidified iodide ions liberating iodine according to the equation below:

$$
\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{I}^{-}(\mathrm{aq}) \longrightarrow \mathrm{I}_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

The kinetics of this reaction was investigated and it was found to have the following rate equation: rate $=k\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right]$

Two series of experiments were conducted, giving rise to Graph A and Graph B.

## Graph A

rate of reaction/ $\mathrm{mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$

## Graph B

Which of the following shows the correct labelling of the $x$-axis for Graph $A$ and $y$-axis for Graph B?

|  | $x$-axis | $y$-axis |
| :---: | :---: | :---: |
| A | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right] / \mathrm{mol}^{2} \mathrm{dm}^{-6}$ | $\left[\mathrm{H}^{+}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |
| B | $\left[\mathrm{H}^{+}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |
| C | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right] / \mathrm{mol}^{2} \mathrm{dm}^{-6}$ | $\left[\mathrm{I}^{-}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |
| D | $\left[\mathrm{H}^{+}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ | $\left[\mathrm{I}^{-}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |

10 A gaseous dimer, $\mathbf{Z}$, is introduced into an empty gas syringe which has a movable, tightly-fitting plunger. The gas is allowed to expand until equilibrium is reached at a controlled temperature at which $20 \%$ of $\mathbf{Z}$ dissociates into its monomer W.

$$
\mathbf{Z}(\mathrm{g}) \rightleftharpoons 2 \mathbf{W}(\mathrm{~g})
$$

Which of the following statements is correct?
A The forward reaction is exothermic.
B The value of the equilibrium constant, $K_{p}$ is 0.167 atm.
C The pressure inside the syringe at equilibrium will be higher than the atmospheric pressure.

D The dissociation of dimer $\mathbf{Z}$ will be favoured when the plunger is pushed back into the equilibrium mixture.

11 The acid dissociation constants for the diprotic acid, malonic acid $\mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}$ are $K_{\mathrm{a} 1}=1.5 \times 10^{-3}$ and $K_{\mathrm{a} 2}=2.0 \times 10^{-6}$.

What is the $K_{\mathrm{b}}$ for $\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}{ }^{-}$?
A $\quad K_{w} \times K_{a 1}$
B $\quad K_{\mathrm{w}} \times K_{\mathrm{a} 2}$
C $K_{w} / K_{\mathrm{a} 1}$
D $\quad K_{w} / K_{\mathrm{a} 2}$

12 Hardness in tap water can be determined by titrating a sample against a reagent which forms complex ions with dissolved metal ions. The indicator for this titration requires the pH to be maintained at about 10 .

Which of the following, in aqueous solution, could be used to maintain the pH at about 10 ?

A $10 \mathrm{~cm}^{3}$ of $2.0 \mathrm{~g} \mathrm{dm}^{-3}$ of sodium hydroxide neutralised by $10 \mathrm{~cm}^{3}$ of $0.025 \mathrm{~mol} \mathrm{dm}^{-3}$ of ethanoic acid

B $5 \mathrm{~cm}^{3}$ of $1.7 \mathrm{~g} \mathrm{dm}^{-3}$ of ammonia neutralised by $10 \mathrm{~cm}^{3}$ of $0.025 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid

C $20 \mathrm{~cm}^{3}$ of $0.05 \mathrm{~mol} \mathrm{dm}^{-3}$ of hydrochloric acid neutralised by $5 \mathrm{~cm}^{3}$ of $1.7 \mathrm{~g} \mathrm{dm}^{-3}$ ammonia

D $10 \mathrm{~cm}^{3}$ of $0.05 \mathrm{~mol} \mathrm{dm}^{-3}$ of ethanoic acid neutralised by $5 \mathrm{~cm}^{3}$ of $2.0 \mathrm{~g} \mathrm{dm}^{-3}$ of sodium hydroxide

13 The solubility product of some sparingly soluble lead compounds are shown below. Which compound will have the lowest concentration of $\mathrm{Pb}^{2+}(\mathrm{aq})$ ions in a saturated solution?

|  | compound | numerical value of solubility product (at $25^{\circ} \mathrm{C}$ ) |
| :---: | :---: | :---: |
| A | lead(II) fluoride | $2.7 \times 10^{-8}$ |
| B | lead(II) bromide | $4.0 \times 10^{-5}$ |
| C | lead(II) iodide | $7.1 \times 10^{-9}$ |
| D | lead(II) sulfate | $1.6 \times 10^{-8}$ |

14 Morphine is a powerful narcotic painkiller which could be isolated from opium poppy. Though it relieves pain effectively, it can cause addiction so readily that it should only be used in the cases where other pain medications are inadequate.

morphine
Which of the following claims about morphine is true?
1 There are 5 chiral carbons present in the molecule.
2 There are $7 \mathrm{C}-\mathrm{C}$ bonds formed by $\mathrm{sp}^{3}-\mathrm{sp}^{3}$ overlap.
3 The molecule cannot exhibit cis-trans isomerism at the $\mathrm{C}=\mathrm{C}$ double bond.
A 1 only
B 2 only
C 2 and 3 only
D 1, 2 and 3

15 Compound L reacts with limited chlorine gas in the presence of sunlight.

compound $\mathbf{L}, \mathrm{C}_{10} \mathrm{H}_{20}$
Assuming that only mono-chlorination takes place and ignoring the relative rates of abstraction of the different type of hydrogen atom, which of the following statements is incorrect?

A The maximum number of chlorinated products formed is 8 .
B $\quad \mathrm{C}_{20} \mathrm{H}_{38}$ is present in small quantities in the products.
C Homolytic fission occurs in both initiation and propagation step.
D The ratio of primary to secondary to tertiary chloroalkanes formed is 3:6:2.

16 Use of the Data Booklet is relevant to this question.
The following transformation takes place in three steps.

Which of the following shows the best choice of reagents and conditions to carry out the transformation?

|  | step 1 | step 2 | step 3 |
| :---: | :---: | :---: | :---: |
| A | $\mathrm{H}_{2}, \mathrm{Pt}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ |
| B | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ | $\mathrm{H}, \mathrm{Pt}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ |
| C | $\mathrm{H}_{2}, \mathrm{Pt}$ | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ |
| D | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{H}_{2}, \mathrm{Pt}$ |

17 A halogen-containing compound, $\mathbf{U}$, is heated with 2 different concentrations of aqueous sodium hydroxide. After acidifying the mixture and adding excess aqueous silver nitrate, the mass of silver halide formed is analysed over a period of time. The following graph for the mass of silver halide precipitate against time was obtained.

Which of the following is the likely structure of $\mathbf{U}$ ?
A
B

C
D

18 The following two compounds react with alkaline aqueous iodine to form yellow precipitate of tri-iodomethane as one of the products.

What is the ratio of sodium hydroxide used to react with 1 mol of compound $\mathbf{V}$ and 1 mol of compound $\mathbf{W}$ respectively?

compound V

compound W

|  | compound $\mathbf{V}$ | compound $\mathbf{~ W ~}$ |
| :---: | :---: | :---: |
| A | 4 | 4 |
| B | 4 | 6 |
| C | 6 | 4 |
| D | 6 | 5 |

19 A fresh salad with tomatoes may contain compound $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCHO}$ which provides an aroma for tomatoes. What will be the final product, $\mathbf{P}$ in this sequence of reactions?

A $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCOOH}$
B $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$
C $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCH}_{2} \mathrm{OH}$
D $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$

20 Two female sex hormones are oestrone and oestradiol.

oestrone

oestradiol

Which of the following reagents could be used to distinguish between the two hormones?
$1 \quad \mathrm{SOCl}_{2}$
$2 \mathrm{KMnO}_{4} / \mathrm{H}^{+}$
$3 \quad \mathrm{LiAlH}_{4}$ in dry ether
A 1,2 and 3
B 1 and 2 only
C 2 and 3 only
D 1 only

21 Ethanoic acid can be made by direct carbonylation of methanol, in presence of a rhodium catalyst.

$$
\mathrm{CH}_{3} \mathrm{OH}+\mathrm{CO} \xrightarrow{\text { rhodium catalyst }} \mathrm{CH}_{3} \mathrm{COOH}
$$

Which of the following can produce compound $\mathbf{S}$ using a similar method?

compound S

A

B

C

D

22 Benzylamine has the formula $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{NH}_{2}$ and is a common precursor in organic synthesis.

Which of the following statements about benzylamine is correct?
1 It reacts with excess $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{Cl}$ to form the compound, $\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{NCl}$.
2 It reacts with $\mathrm{CH}_{3} \mathrm{COOH}$ to form $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{NHCOCH}_{3}$.
3 It can be distinguished from $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{NH}_{2}$ by the use of aqueous bromine.
A 1,2 and 3
B 1 and 2 only
C 1 only
D 2 and 3 only

23 The structures of some nitrogen containing compounds are shown below.

compound $\mathbf{H}$

compound $\mathbf{J}$

compound I

compound K

What is the order of increasing basicity of the nitrogen containing compounds?

|  | least basic | most basic |  |  |
| :---: | :---: | :---: | :--- | :---: |
| A | I | H | K | J |
| B | I | K | H | J |
| C | I | K | J | H |
| D | K | I | J | H |

24 Use of Data Booklet is relevant to this question.
Which statements about the elements chlorine, bromine and iodine are correct?
1 The oxidising power decreases from chlorine to iodine.
2 The bond length of the molecule increases from chlorine to iodine.
3 The magnitude of the first electron affinity increases from chlorine to iodine.
A 1 and 2 only
B 1 and 3 only
C 2 and 3 only
D 1, 2 and 3

25 Which diagram correctly shows the trend in a property of the Group 2 elements $\mathrm{Mg}, \mathrm{Ca}, \mathrm{Sr}, \mathrm{Ba}$ ?
A $\Delta H_{\text {hyd }}$, the enthalpy change of hydration of $\mathrm{M}^{2+}(\mathrm{g})$

B $\quad I$, the first ionisation energy

C $\quad E^{\ominus}$, the standard electrode potential of $\mathrm{M}^{2+}(\mathrm{aq}) \mathrm{I} \mathrm{M}(\mathrm{s})$ electrode

D Electronegativity value

26 Three half cells are constructed as follows.

Half cell I: an electrode of metal $\mathbf{Q}$ in a 1.0 M solution of $\mathbf{Q}^{+}(\mathrm{aq})$ ions
Half cell II: an electrode of metal $\mathbf{R}$ in a 1.0 M solution of $\mathbf{R}^{+}(\mathrm{aq})$ ions
Half cell III: an electrode of Cu metal in a 1.0 M solution of $\mathrm{Cu}^{2+}(\mathrm{aq})$ ions
The half cells are connected in pairs, as shown below, to form a series of galvanic cells. For each cell, the polarity of the electrodes and the voltage generated are recorded.

| half cells <br> used | positive <br> electrode | negative <br> electrode | voltage (V) |
| :---: | :---: | :---: | :---: |
| I and III | Cu | $\mathbf{Q}$ | 0.57 |
| II and III | Cu | $\mathbf{R}$ | 1.10 |
| I and II | $\mathbf{Q}$ | $\mathbf{R}$ | 0.53 |

Which one of the following lists the metals in order of increasing strength as reducing agents?

A R, Q, Cu
B $\quad \mathbf{Q}, \mathrm{Cu}, \mathbf{R}$
C $\mathrm{Cu}, \mathrm{R}, \mathrm{Q}$
D $\mathrm{Cu}, \mathbf{Q}, \mathbf{R}$

27 Some standard redox potential $\left(E^{\ominus}\right)$ values are given in the table below.

| electrode reaction | $E^{\ominus / V}$ |
| :---: | :---: |
| $\mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{e} \rightleftharpoons \mathrm{Fe}^{2+}(\mathrm{aq})$ | +0.77 |
| $\mathrm{Sn}^{4+}(\mathrm{aq})+2 \mathrm{e} \rightleftharpoons \mathrm{Sn}^{2+}(\mathrm{aq})$ | +0.15 |
| $\mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{e} \rightleftharpoons \mathrm{Ce}^{3+}(\mathrm{aq})$ | +1.45 |

Which of the following reactions would occur under standard conditions?
$1 \quad \mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{Fe}^{2+}(\mathrm{aq}) \longrightarrow \mathrm{Ce}^{3+}(\mathrm{aq})+\mathrm{Fe}^{3+}(\mathrm{aq})$
$2 \quad \mathrm{Sn}^{2+}(\mathrm{aq})+2 \mathrm{Fe}^{3+}(\mathrm{aq}) \longrightarrow \mathrm{Sn}^{4+}(\mathrm{aq})+2 \mathrm{Fe}^{2+}(\mathrm{aq})$
$3 \quad 2 \mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{Sn}^{2+}(\mathrm{aq}) \longrightarrow 2 \mathrm{Ce}^{3+}(\mathrm{aq})+\mathrm{Sn}^{4+}(\mathrm{aq})$
A 1, 2 and 3
B 1 and 2 only
C 2 and 3 only
D 1 only

28 A current was passed through two cells connected in series. The first cell contained molten sodium chloride while the other contained a molten aluminium salt.

What would be the mass of aluminium liberated from the other cell if 4.6 g of sodium was liberated from the first cell?

A $\quad 0.9 \mathrm{~g}$
B $\quad 1.8 \mathrm{~g}$
C $\quad 2.7 \mathrm{~g}$
D $\quad 3.6 \mathrm{~g}$

29 Which of the following does not act as a ligand in the formation of complexes?
A $\mathrm{SCN}^{-}$
B $\mathrm{Cl}^{-}$
C $\mathrm{AlH}_{4}-$
D $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$

30 A reaction scheme starting from aqueous copper(II) sulfate solution is shown below. Both $X$ and $Y$ are copper-containing species.

Which of the following statements is true?
$1 \quad \mathrm{NH}_{3}$ acts as a ligand in reaction I.
2 Reaction II is a redox reaction.
3 The entropy of the system increases when reaction III occurs.
A 1 only
B 3 only
C $\quad 1$ and 3 only
D 1, 2 and 3 only

| 1 | D | 11 | C | 21 | D |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | B | 12 | B | 22 | C |
| 3 | B | 13 | D | 23 | B |
| 4 | A | 14 | D | 24 | A |
| 5 | B | 15 | D | 25 | A |
| 6 | C | 16 | B | 26 | D |
| 7 | C | 17 | A | 27 | A |
| 8 | C | 18 | D | 28 | B |
| 9 | A | 19 | A | 29 | C |
| 10 | B | 20 | D | 30 | B |

1 The Basic Oxygen steel-making process is a method of preparing steel from carbon-rich molten pig iron. The process is basic because chemical bases are added to remove impurities. One such impurity is phosphorus pentoxide, $\mathrm{P}_{4} \mathrm{O}_{10}$. Calcium oxide, CaO , is added to remove it and the only product of the reaction is the salt, calcium phosphate, $\mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$.

How many moles of CaO reacted with one mole of $\mathrm{P}_{4} \mathrm{O}_{10}$ in this reaction?
A 1
B $\quad 1.5$
C 3
D 6
$\mathrm{P}_{4} \mathrm{O}_{10}+6 \mathrm{CaO} \rightarrow 2 \mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$
Given that $\mathrm{Ca}_{3} \mathrm{PO}_{4}$ is the only product, write the balanced equation between $\mathrm{P}_{4} \mathrm{O}_{10}$ and CaO to form $\mathrm{Ca}_{3} \mathrm{PO}_{4}$. Based on mole ratio, 6 moles of CaO is required to completely react with one mole of $\mathrm{P}_{4} \mathrm{O}_{10}$.
Answer: D

2 Two moles of an oxidising agent, $\mathrm{XO}_{4}{ }^{-}$in the presence of excess acid oxidised $96 \mathrm{dm}^{3}$ of nitrogen dioxide gas at room temperature and pressure to $\mathrm{NO}_{3}{ }^{-}$.

What is the number of moles of electrons accepted by one mole of $\mathrm{XO}_{4}{ }^{-}$?
A 1
B 2
C 3
D 4
$\mathrm{n}\left(\mathrm{NO}_{2}\right)=96 / 24=4$
$\mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{NO}_{3}^{-}+2 \mathrm{H}^{+}+\mathrm{e}$
$\mathrm{XO}_{4}{ }^{-} \equiv \mathrm{NO}_{2}$
2 : 4
1 : 2
2 mol of $\mathrm{NO}_{2}$ donate 2 mol of e which is accepted by 1 mol of $\mathrm{XO}_{4}^{-}$

3 Use of the Data Booklet is relevant to this question.
The ion $\mathbf{T}^{+}$contains 28 electrons and 35 neutrons.
Which of the following statements about $\mathbf{T}^{+}$or $\mathbf{T}$ is correct?
A T and $\mathrm{Ga}^{3+}$ are isoelectronic species.
B The elemental form of $\mathbf{T}$ can be oxidised by chlorine.
C The electronic configuration of $\mathbf{T}^{+}$ion is $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 3 d^{9} 4 s^{1}$.
D The angle of deflection of ${ }^{27} \mathrm{~A} \mathrm{l}^{3+}$ is approximately three times that of $\mathbf{T}^{+}$in an electric field.
Since ion $\mathbf{T}^{+}$contains 28 electrons, element $\mathbf{T}$ is copper which contains 29 electrons.
Option A is wrong as $\mathrm{Ga}^{3+}$ has 28 electrons, hence $\mathbf{T}$ and $\mathrm{Ga}^{3+}$ do not have the same number of electrons.

Option B is correct as Cu can be oxidised to $\mathrm{Cu}^{2+}$ by chlorine.

$$
\begin{aligned}
& \mathrm{Cu}^{2+}+2 \mathrm{e} \rightleftharpoons \mathrm{Cu} \quad \mathrm{E}^{\ominus}=+0.34 \mathrm{~V} \\
& \mathrm{Cl}_{2}+2 \mathrm{e} \rightleftharpoons 2 \mathrm{Cl}^{-} \quad \mathrm{E}^{\ominus}=+1.36 \mathrm{~V} \\
& \mathrm{E}_{\text {cell }}=+1.36-(+0.34)=+1.02 \mathrm{~V}
\end{aligned}
$$

Option $C$ is wrong as the electronic configuration of $\mathbf{T}^{+}$ion is $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 3 d^{10}$.
Option D is wrong as the angle of deflection of ${ }^{27} \mathrm{~A} \mathrm{I}^{3+}$ is not approximately three times that of $\mathbf{T}^{+}$in an electric field.

The angle of deflection depends on the charge-to-mass ratio of the particles.
Angle of deflection of $\mathrm{A} \mathrm{l}^{3+}=\mathrm{k}\left(\frac{3}{27}\right)=0.111 \mathrm{k}$
Angle of deflection of $\mathbf{T}^{+}=k\left(\frac{1}{64}\right)=0.0156 \mathrm{k}$
Answer: B

4 Which of the following species has a different bond angle from the rest?
A $\mathrm{ICl}_{3}$

B $\mathrm{SF}_{3}{ }^{+}$
C $\mathrm{ClO}_{3}{ }^{-}$
D $\mathrm{N}_{2} \mathrm{H}_{4}$

Answer: A

5 What will happen to the volume of a bubble of air submerged in water under a lake at $10.0^{\circ} \mathrm{C}$ and 2.00 atm if it rises to the surface where the temperature is $20.0^{\circ} \mathrm{C}$ and the pressure is 1.00 atm ?

A The volume will increase by a factor of 2.00.
B The volume will increase by a factor of 2.07 .
C The volume will decrease by a factor of 2.00 .
D The volume will decrease by a factor of 1.93 .
Answer : B
$\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2}$
$2\left(\mathrm{~V}_{1}\right) /(273+10)=1\left(\mathrm{~V}_{2}\right) /(273+20)$
$\mathrm{V}_{2}=293 \times(2) \times \mathrm{V}_{1} / 283=2.07 \mathrm{~V}_{1}$

6 The graph below shows the variation in the standard enthalpy change of fusion, $\Delta H^{\rho}$ fus for 8 consecutive elements from period 2 to 3 in the periodic table.

Standard enthalpy change of fusion is the heat absorbed when one mole of a substance changes its state from solid to liquid under standard conditions.

Which of the following statements is true based on the information deduced from the above graph?

A The chlorides become more acidic from $\mathbf{A}$ to $\mathbf{C}$.
B An oxide of $\mathbf{E}$ dissolves in water to form an alkaline solution.
C Element $\mathbf{G}$ has a higher first ionisation energy than element $\mathbf{F}$ and $\mathbf{H}$.
D Element $\mathbf{D}$ has a lower electrical conductivity as compared to element $\mathbf{F}$.
Since $\mathbf{F}$ is an element from period 2 to 3 , and it has the largest $\Delta H^{\circ}$ fus (the rest of the elements have much lower $\left.\Delta H^{\circ} \mathrm{fus}\right), \mathbf{F}$ must be Si . Si has a giant covalent structure with high melting point and $\Delta H^{9}$ fus.

So $\mathbf{A}$ is fluorine, $\mathbf{B}$ is neon, $\mathbf{C}$ is sodium, $\mathbf{D}$ is magnesium, $\mathbf{E}$ is aluminium, $\mathbf{G}$ is phosphorus and $\mathbf{H}$ is sulfur.

Option A is wrong as sodium chloride is a neutral chloride and there is no chloride of fluorine (fluorine reacts with chlorine to form chlorine fluoride instead). There is no reaction between neon and chlorine.
Option B is wrong as aluminium oxide is insoluble in water.
Option C is correct as phosphorus has a higher first ionisation energy than silicon and sulfur.

Option D is wrong as magnesium has a higher electrical conductivity as compared to silicon.

Answer: $\boldsymbol{C}$

7 Some enthalpy changes of combustion are given below.

|  | $\Delta H_{c} / \mathrm{kJ} \mathrm{mol}^{-1}$ |
| :---: | :---: |
| $\mathrm{CO}(\mathrm{g})$ | -283 |
| $\mathrm{H}_{2}(\mathrm{~g})$ | -286 |
| $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})$ | -715 |

What is the enthalpy change of the following reaction?

$$
\mathrm{CO}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow \mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})
$$

A -146
B $\quad+146$
C $\quad-140$
D $\quad+140$
Answer: C

By Hess' law: $\Delta H_{r}=\Delta H_{c}$ (reactants) $-\Delta H_{c}$ (products)

$$
=-283+2(-286)-(-715)=-140 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

8 The reaction of nitrogen monoxide and hydrogen gas

$$
2 \mathrm{NO}(\mathrm{~g})+2 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow \mathrm{N}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

is thought to involve the following steps:

Which of the following about the reaction is true?

A $\quad \mathrm{H}_{2}$ acts as the catalyst.
B $\quad$ The rate equation for the reaction is rate $=k\left[\mathrm{~N}_{2} \mathrm{O}_{2}\right]\left[\mathrm{H}_{2}\right]$.
C The overall order of the reaction is 3 .
D Increasing the concentration of NO does not change the rate of reaction.
Answer: C
A is incorrect as there is insufficient information to deduce that $\mathrm{H}_{2}$ is the catalyst.
$B$ is incorrect.
Based on the slow step:
Rate $=\mathrm{k}\left[\mathrm{N}_{2} \mathrm{O}_{2}\right]\left[\mathrm{H}_{2}\right]$
However, $\mathrm{N}_{2} \mathrm{O}_{2}$ is not present in the final equation, this show that it is an intermediate and should not be present in the rate equation.

Based on step I,
$\left[\mathrm{N}_{2} \mathrm{O}_{2}\right] \propto \mathrm{k}^{\prime}[\mathrm{NO}]^{2}$
Rate $\left.=k^{\prime}\left[\mathrm{NO}^{2}\right]^{2} \mathrm{H}_{2}\right]$
C is correct.
Based on the rate equation, overall order is 3.
$D$ is incorrect. Since NO is present in the rate equation, increasing the concentration will increase the rate of reaction

9 Hydrogen peroxide reacts with acidified iodide ions liberating iodine according to the equation below:

$$
\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{I}^{-}(\mathrm{aq}) \longrightarrow \mathrm{I}_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

The kinetics of this reaction was investigated and it was found to have the following rate equation: rate $=k\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right]$

Two series of experiments were conducted, giving rise to Graph A and Graph B.

## Graph A

rate of reaction/ $\mathrm{mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}$

## Graph B

Which of the following shows the correct labelling of the x -axis for Graph A and y -axis for Graph B?

|  | $x$-axis | $y$-axis |
| :---: | :---: | :---: |
| A | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right] / \mathrm{mol}^{2} \mathrm{dm}^{-6}$ | $\left[\mathrm{H}^{+}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |
| B | $\left[\mathrm{H}^{+}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |
| C | $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right] / \mathrm{mol}^{2} \mathrm{dm}^{-6}$ | $\left[\mathrm{I}^{-}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |
| D | $\left[\mathrm{H}^{+}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ | $\left[\mathrm{I}^{-}\right] / \mathrm{mol} \mathrm{dm}^{-3}$ |

Answer: A
Graph A:
As the rate eqn is rate $=\mathrm{k}\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right]$
If $y=m x$, then $y$ axis $=$ rate
$x$-axis is $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]\left[\mathrm{I}^{-}\right]$
Graph B: It shows a zero order concentration-time graph (constant rate/grad), it is first order wrt to $\left[\mathrm{H}_{2} \mathrm{O}_{2}\right]$ and $\left[\mathrm{I}^{-}\right]$. It is zero order wrt to $\left[\mathrm{H}^{+}\right]$.

10 A gaseous dimer, $\mathbf{Z}$, is introduced into an empty gas syringe which has a movable, tightly-fitting plunger. The gas is allowed to expand until equilibrium is reached at a controlled temperature at which $20 \%$ of $\mathbf{Z}$ dissociates into its monomer $\mathbf{W}$.

$$
\mathbf{Z}(\mathrm{g}) \rightleftharpoons 2 \mathbf{W}(\mathrm{~g})
$$

Which of the following statements is correct?
A The forward reaction is exothermic.
B The value of the equilibrium constant, $K_{p}$ is 0.167 atm.
C The pressure inside the syringe at equilibrium will be higher than the atmospheric pressure.

D The dissociation of dimer $\mathbf{Z}$ will be favoured when the plunger is pushed back into the equilibrium mixture.

Answer: B
Option A
The dissociation of a dimer only involves "bond breaking" and thus is an endothermic process.

## Option B

Let the initial amount (mol) of $\mathbf{X}$ be ' $a$ '

$$
\mathbf{X}(\mathrm{g}) \rightleftharpoons 2 \mathbf{W}(\mathrm{~g})
$$

| Initial $/ \mathrm{mol}$ | a | 0 |
| :--- | :---: | :---: |
| Change $/ \mathrm{mol}-0.2 \mathrm{a}$ | +0.4 a |  |
| Eqm $/ \mathrm{mol}$ | 0.8 a | 0.4 a |

$P_{\mathrm{w}}=(0.4 \mathrm{a} / 1.2 \mathrm{a}) \times 1 \mathrm{~atm}=1 / 3 \mathrm{~atm}$
$P_{\mathrm{x}}=(0.8 \mathrm{a} / 1.2 \mathrm{a}) \times 1 \mathrm{~atm}=2 / 3 \mathrm{~atm}$
$\mathrm{K}_{\mathrm{p}}=\mathrm{Pw}^{2} / \mathrm{P}_{\mathrm{x}}=(1 / 3)^{2} /(2 / 3)=1 / 6 \mathrm{~atm}=0.167 \mathrm{~atm}$

## Option C

The final pressure inside the syringe will have to be the same as atmospheric pressure ( 1 atm ) to ensure that the syringe stops moving.

## Option D

Pushing the plunger back will decrease volume, and thus cause the pressure of the system to increase.

Based on Le Chatelier's Principle, equilibrium position will shift to the left which has lesser gaseous particles to reduce the pressure. Thus association of $\mathbf{W}$ is favoured.

11 The acid dissociation constants for the diprotic acid, malonic acid $\mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}$ are $K_{\mathrm{a} 1}=1.5 \times 10^{-3}$ and $K_{\mathrm{a} 2}=2.0 \times 10^{-6}$.

What is $K_{\mathrm{b}}$ for $\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}{ }^{-}$?
A $\quad K_{w} \times K_{\mathrm{a} 1}$
B $\quad K_{w} \times K_{\mathrm{a} 2}$
C $K_{w} / K_{\mathrm{a} 1}$
D $\quad K_{w} / K_{\mathrm{a} 2}$
Answer: $\boldsymbol{C}$
$\mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4} \rightleftharpoons \quad \mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}^{-}+\mathrm{H}^{+} \quad \mathrm{K}_{\mathrm{a} 1}=1.5 \times 10^{-3}$
$\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}{ }^{-} \rightleftharpoons \quad \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}{ }^{2-}+\mathrm{H}^{+} \quad \mathrm{K}_{\mathrm{a} 2}=2.0 \times 10^{-6}$
Measurement for $\mathrm{K}_{\mathrm{b}}, \mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}$ - would be acting as a base accepting proton

$$
\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}^{-}+\mathrm{H}^{+} \rightleftharpoons \mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}
$$

$\mathrm{K}_{\mathrm{w}}=\mathrm{K}_{\mathrm{a} 1}\left(\mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}\right) \times \mathrm{K}_{\mathrm{b}}\left(\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}{ }^{-}\right) \quad\left(\mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}\right.$ and $\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}{ }^{-}$are conjugate acid-base pair)
$\mathrm{K}_{\mathrm{b}}\left(\mathrm{HC}_{3} \mathrm{H}_{2} \mathrm{O}_{4}^{-}\right)=\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{a} 1}\left(\mathrm{H}_{2} \mathrm{C}_{3} \mathrm{H}_{2} \mathrm{O}_{4}\right)$

12 Hardness in tap water can be determined by titrating a sample against a reagent which forms complex ions with dissolved metal ions. The indicator for this titration requires the pH to be maintained at about 10 .

Which of the following, in aqueous solution, could be used to do this?
A $10 \mathrm{~cm}^{3}$ of $2.0 \mathrm{~g} \mathrm{dm}^{-3}$ of sodium hydroxide neutralised by $10 \mathrm{~cm}^{3}$ of 0.025 $\mathrm{mol} \mathrm{dm}{ }^{-3}$ of ethanoic acid

B $\quad 5 \mathrm{~cm}^{3}$ of $1.7 \mathrm{~g} \mathrm{dm}^{-3}$ of ammonia neutralised by $10 \mathrm{~cm}^{3}$ of $0.025 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid
C $20 \mathrm{~cm}^{3}$ of $0.05 \mathrm{~mol} \mathrm{dm}^{-3}$ of hydrochloric acid neutralised by $5 \mathrm{~cm}^{3}$ of $1.7 \mathrm{~g} \mathrm{dm}^{-3}$ ammonia

D $\quad 10 \mathrm{~cm}^{3}$ of $0.05 \mathrm{~mol} \mathrm{dm}^{-3}$ of ethanoic acid neutralised by $5 \mathrm{~cm}^{3}$ of $2.0 \mathrm{~g} \mathrm{dm}^{-3}$ of sodium hydroxide

## Answer: B

To maintain solution at pH 10 we need basic buffer which is made of weak base and its salt

Option (A) is made of sodium hydroxide (strong acid) and sodium ethanoate salt
Option (B) is made of ammonia and ammonium chloride (weak base and its salt)
Option (C) is made of hydrochloric acid and ammonium chloride
Option (D) is made up of ethanoic acid and sodium ethanoate

13 The solubility product of some sparingly soluble lead compounds are shown below. Which compound will have the lowest concentration of $\mathrm{Pb}^{2+}(\mathrm{aq})$ ions in a saturated solution?

|  | compound | numerical value of solubility product (at $25^{\circ} \mathrm{C}$ ) |
| :---: | :---: | :---: |
| A | lead(II) fluoride | $2.7 \times 10^{-8}$ |
| B | lead(II) bromide | $4.0 \times 10^{-5}$ |
| C | lead(II) iodide | $7.1 \times 10^{-9}$ |
| D | lead(II) sulfate | $1.6 \times 10^{-8}$ |

For the lead halides, $\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{2+}\right][\mathrm{X}-]^{2}$ where $\mathrm{X}=\mathrm{F}, \mathrm{Br}$ or I
Let $\left[\mathrm{Pb}^{2+}\right]$ be $\mathrm{x} \mathrm{mol} \mathrm{dm}{ }^{-3}$
Hence [ $\mathrm{X}^{-}$] is $2 \mathrm{x} \mathrm{mol} \mathrm{dm}^{-3}$
$K s p$ is hence $4 x^{3}$
For $\mathrm{PbBr}_{2},\left[\mathrm{~Pb}^{2+}\right]=0.0215 \mathrm{~mol} \mathrm{dm}^{-3}$
For $\mathrm{PbF}_{2},\left[\mathrm{~Pb}^{2+}\right]=1.89 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
For $\mathrm{Pbl}_{2},\left[\mathrm{~Pb}^{2+}\right]=1.21 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
For $\mathrm{PbSO}_{4}, \mathrm{~K}_{\mathrm{sp}}=\left[\mathrm{Pb}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right]$.
Hence $\left[\mathrm{Pb}^{2+}\right]=\sqrt{ } \mathrm{K}_{\text {sp }}$
$\left[\mathrm{Pb}^{2+}\right]=1.26 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$
Answer: D

14 Morphine is a powerful narcotic painkiller which could be isolated from opium poppy. Though it relieves pain effectively, it can cause addiction so readily that it should only be used in the cases where other pain medications are inadequate.
morphine
Which of the following claims about morphine is true?
1 There are 5 chiral carbons present in the molecule.
2 There are $7 \mathrm{C}-\mathrm{C}$ bonds formed by $\mathrm{sp}^{3}-\mathrm{sp}^{3}$ overlap.
3 The molecule cannot exhibit cis-trans isomerism at the $\mathrm{C}=\mathrm{C}$ double bond.
A 1 only
B 2 only
C 2 and 3 only
D 1, 2 and 3

There are 5 chiral carbons present in the molecule, indicated by the asterisks and there are $7 \mathrm{C}-\mathrm{C}$ bonds formed by $\mathrm{sp}^{3}-\mathrm{sp}^{3}$ overlap, highlighted in the diagram. The molecule cannot exhibit cis-trans isomerism at the $\mathrm{C}=\mathrm{C}$ double bond as the trans isomer could not exist.

Answer: D

15 Compound L reacts with limited chlorine gas in the presence of sunlight.

compound $\mathbf{L}, \mathrm{C}_{10} \mathrm{H}_{20}$
Assuming that only mono-chlorination takes place and ignoring the relative rates of abstraction of the different type of hydrogen atom, which of the following statements is incorrect?

A The maximum number of chlorinated products formed is 8 .
B $\quad \mathrm{C}_{20} \mathrm{H}_{38}$ is present in small quantities in the products.
C Homolytic fission occurs in both initiation and propagation step.
D The ratio of primary to secondary to tertiary chloroalkanes formed is 3:6:2.

Option A is correct. The maximum number of chlorinated products formed is 8 .
Option B is correct. Since compound $\mathbf{L}$ has the molecular formulae of $\mathrm{C}_{10} \mathrm{H}_{20}$, it can form a radical with the molecular formula of $\mathrm{C}_{10} \mathrm{H}_{19}$ in the first step of propagation. Hence two radicals of $\mathrm{C}_{10} \mathrm{H}_{19}$ can react in the termination step to form $\mathrm{C}_{20} \mathrm{H}_{38}$ as one of the side products.

Option C is correct. Homolytic fission occurs in both initiation and propagation step.

## Initiation step:

Propagation step:
Let $R$ be the rest of the molecule.

Option D is incorrect.
When $\mathrm{H}_{1}$ and $\mathrm{H}_{4}$ atoms are substituted (total of 6 hydrogen atoms), primary chloroalkanes will be formed.

When $\mathrm{H}_{2}, \mathrm{H}_{6}, \mathrm{H}_{7}$ and $\mathrm{H}_{8}$ atoms are substituted (total of 12 hydrogen atoms), secondary chloroalkanes will be formed.

When $\mathrm{H}_{3}$ and $\mathrm{H}_{5}$ atoms are substituted (total of 2 hydrogen atoms), tertiary chloroalkanes will be formed.

Hence the ratio of primary to secondary to tertiary chloroalkanes formed is 6:12:2 => 3:6:1 instead of 3:6:2.

Answer: D

16 Use of the Data Booklet is relevant to this question.
The following transformation takes place in three steps.

Which of the following shows the best choice of reagents and conditions to carry out the transformation?

|  | step 1 | step 2 | step 3 |
| :---: | :---: | :---: | :---: |
| A | $\mathrm{H}_{2}, \mathrm{Pt}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ |
| B | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ | $\mathrm{H}, \mathrm{Pt}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ |
| C | $\mathrm{H}_{2}, \mathrm{Pt}$ | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ |
| D | $\mathrm{Br}_{2}, \mathrm{FeBr}_{3}$ | conc $\mathrm{HNO}_{3}$, conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{H}_{2}, \mathrm{Pt}$ |

The position of the incoming group, $\mathbf{E}$, is determined by the nature of the group, $\mathbf{G}$, already bonded to the ring, and not by the nature of the incoming group E .

| G | $\begin{aligned} & \text { Calkyl } \\ & -\mathrm{NH}_{\text {or }}-\mathrm{OR} \\ & -\mathrm{NH}_{2},-\mathrm{NHR} \text { or }-\mathrm{NR}_{2} \\ & -\mathrm{NHCOR} \end{aligned}$ | $-\mathrm{Cl},-\mathrm{Br}-\mathrm{I}$ | $\begin{aligned} & -\mathrm{CHO},-\mathrm{COR} \\ & -\mathrm{CO}_{2} \mathrm{H},-\mathrm{CO}_{2} \mathrm{R} \\ & -\mathrm{NH}_{3}^{+} \\ & -\mathrm{NO}_{2}-\mathrm{CN} \end{aligned}$ |
| :---: | :---: | :---: | :---: |
| Reactivity of ring (compared to benzene) | Activated | Deactivated | Deactivated |
| Position of E (relative to position of G) | 2- and/or 4- | 2- and/or 4- | $3-$ |

The circled groups will be needed to decide the correct way of transformation in this question.

Note that $-\mathrm{NO}_{2}$ group is an electron-withdrawing group and strong deactivating, it will direct incoming electrophile to the $3^{\text {rd }}$ position relative to itself.

Answer: B

17 A halogen-containing compound, $\mathbf{U}$, is heated with 2 different concentrations of aqueous sodium hydroxide. After acidifying the mixture and adding excess aqueous silver nitrate, the mass of silver halide formed is analysed over a period of time. The following graph for the mass of silver halide precipitate against time was obtained.

Which of the following is the likely structure of $\mathbf{U}$ ?
A
B

C
D

The gradient of the graph gives the rates of reaction.
The graph shows that the rate of formation of the ppt increases when $\left[\mathrm{OH}^{-}\right]$increases from 0.10 M to 0.20 M . Hence the nucleophilic substitution of the alkyl halide involves $\mathrm{OH}^{-}$in the slow step. (i.e. Compound U can undergo SN 2 mechanism, so it must be primary or secondary alkyl halide)

A is a secondary alkyl halide, so its rate of reaction is affected by $\left[\mathrm{OH}^{-}\right]$.
$B$ is a tertiary alkyl halide, so its rate of reaction is not affected by $\left[\mathrm{OH}^{-}\right]$.
$C$ is a vinyl halide (halogen atom bonded to alkene functional group), so it is resistant to nucleophilic substitution.
D is a chloride salt, so it form silver halide ppt immediately.
Answer: A

18 The following two compounds react with alkaline aqueous iodine to form yellow precipitate of tri-iodomethane as one of the products.

What is the ratio of sodium hydroxide used to react with 1 mol of compound $\mathbf{V}$ and 1 mol of compound $\mathbf{W}$ respectively?

compound V

compound W

|  | compound $\mathbf{V}$ | compound $\mathbf{~ W ~}$ |
| :---: | :---: | :---: |
| A | 4 | 4 |
| B | 4 | 6 |
| C | 6 | 4 |
| D | 6 | 5 |

Hence the ratio of sodium hydroxide used to react with 1 mol of compound $\mathbf{V}$ and 1 mol of compound $\mathbf{W}$ respectively is 6 : 5 .

Note that phenol is acidic enough to react with sodium hydroxide, but not alcohol.
Answer: D

19 A fresh salad with tomatoes may contain compound $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCHO}$ which provides an aroma for tomatoes. What will be the final product, $\mathbf{P}$ in this sequence of reactions?

A $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCOOH}$
B $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$
C $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCH}_{2} \mathrm{OH}$
D $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$
In $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCHO}$ the aldehyde group undergoes reduction by $\mathrm{NaBH}_{4}$ to form primary alcohol group in $\mathrm{P}, \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCH}_{2} \mathrm{OH}$. The primary alcohol group in $P$ is then oxidized to acid group in $Q \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHCOOH}$ by $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7} / \mathrm{H}^{+}$, heat
$\mathrm{C}=\mathrm{C}$ is not reduced by $\mathrm{NaBH}_{4}$ and not oxidized by $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7} / \mathrm{H}^{+}$, heat
Answer: A

20 Two female sex hormones are oestrone and oestradiol.

Which of the following reagents could be used to distinguish between the two hormones?
$1 \quad \mathrm{SOCl}_{2}$
$2 \quad \mathrm{KMnO}_{4} / \mathrm{H}^{+}$
$3 \quad \mathrm{LiA} / \mathrm{H}_{4}$ in dry ether
A 1,2 and 3
B 1 and 2 only
C 2 and 3 only
D 1 only

Answer: $\underline{\mathbf{D}}$ (1 only is correct)

## Option 1 (Correct)

$\mathrm{SOC}_{2}$ reacts with the secondary alcohol group in oestradiol to give white fumes of HCl . Oestrone does not have the secondary alcohol group.

## Option 2 (Wrong)

Both can react with $\mathrm{KMnO}_{4}$ due to the alkyl side chain of benzene, in addition to the secondary alcohol group in oestradiol.

## Option 3 (Wrong)

While $\mathrm{LiA} / \mathrm{H}_{4}$ reacts with the ketone group in oestrone and not with oestradiol, there is no way to distinguish based on absence of visible change.

21 Ethanoic acid can be made by direct carbonylation of methanol, in presence of a rhodium catalyst.

$$
\mathrm{CH}_{3} \mathrm{OH}+\mathrm{CO} \xrightarrow{\text { rhodium catalyst }} \mathrm{CH}_{3} \mathrm{COOH}
$$

Which of the following can produce compound $\mathbf{S}$ using a similar method?

compound $\mathbf{S}$

A

B

C

D

Answer:
Pattern recognition of adding a CO between the C and O atom.
rhodium catalyst

To form compound S,

22 Benzylamine has the formula $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{NH}_{2}$ and is a common precursor in organic synthesis.

Which of the following statements about benzylamine is correct?
1 It reacts with excess $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{Cl}$ to form the compound, $\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{NCl}$.
2 It reacts with $\mathrm{CH}_{3} \mathrm{COOH}$ to form $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{NHCOCH}_{3}$.
3 It can be distinguished from $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{NH}_{2}$ by the use of aqueous bromine.
A 1, 2 and 3
B 1 and 2 only
C 1 only
D 2 and 3 only
1 is correct
Benzylamine undergoes nucleophilic substitution with $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{Cl}$ to form a quarternary ammonium salt.

2 is incorrect
Benzylamine reacts with $\mathrm{CH}_{3} \mathrm{COOH}$ to form an ionic salt.
3 is incorrect
Both cannot decolourise bromine. Phenylamine will decolourise bromine but not benzylamine.

23 The structures of some nitrogen containing compounds are shown below.

compound $\mathbf{H}$

compound I

compound $\mathbf{J}$

compound K

What is the order of increasing basicity of the nitrogen containing compounds?

|  | least basic | most basic |  |  |
| :---: | :---: | :---: | :--- | :---: |
| A | I | H | K | J |
| B | I | K | H | J |
| C | I | K | J | H |
| D | K | I | J | H |

Methyl group is electron donating and it increases the electron density on nitrogen in J Lone pair of electrons on nitrogen in H is delocalised into the benzene ring, hence it is less available for accepting a proton.
K is a neutral compound as the lone pair of electrons on nitrogen is delocalised into $\mathrm{C}=\mathrm{O}$ group.
$I$ is an acidic compound due to salt hydrolysis, hence it is least basic.

24 Use of Data Booklet is relevant to this question.
Which statements about the elements chlorine, bromine and iodine are correct?
1 The oxidising power decreases from chlorine to iodine.
2 The bond length of the molecule increases from chlorine to iodine.
3 The magnitude of the first electron affinity increases from chlorine to iodine.
A 1 and 2 only
B 1 and 3 only
C 2 and 3 only
D 1, 2 and 3

## Option 1 (Correct)

Down the group from chlorine to iodine, increasing shielding effect results in lower effective nuclear charge, hence less ability to attract electrons resulting in decreasing oxidizing power down the group

Option 2 (Correct)
Down the group, size of atoms increases resulting in less effective orbital overlap between two halogen atoms in a covalent bond and hence longer bond length of the molecule

## Option 3 (Incorrect)

$X(\mathrm{~g})+\mathrm{e}^{-} \longrightarrow \mathrm{X}^{-}(\mathrm{g})$
The magnitude of first electron depends on the effective nuclear charge which decreases as the shielding effect increases down the group from chlorine to iodine

Answer: A

25 Which diagram correctly shows the trend in a property of the Group 2 elements $\mathrm{Mg}, \mathrm{Ca}, \mathrm{Sr}, \mathrm{Ba}$ ?

A $\Delta H_{\text {hyd }}$, the enthalpy change of $\mathbf{B} \quad I$, the first ionisation energy hydration of $\mathrm{M}^{2+}(\mathrm{g})$

C $\mathrm{E}^{\circ}$, the standard electrode potential of $\mathrm{M}^{2+}(\mathrm{aq}) \mathrm{I} \mathrm{M}(\mathrm{s})$ electrode

D Electronegativity value

Enthalpy change of hydration is proportional to charge/radius of cation and it is an attraction force hence exothermic

As cation radii, increases from $\mathrm{Mg}^{2+}$ to $\mathrm{Ba}^{2+}$, the enthalpy change of hydration becomes less exothermic.

Answer: A

26 Three half cells are constructed as follows.

Half cell I: an electrode of metal $\mathbf{Q}$ in a 1.0 M solution of $\mathbf{Q}^{+}(\mathrm{aq})$ ions
Half cell II: an electrode of metal $\mathbf{R}$ in a 1.0 M solution of $\mathbf{R}^{+}(\mathrm{aq})$ ions
Half cell III: an electrode of Cu metal in a 1.0 M solution of $\mathrm{Cu}^{2+}(\mathrm{aq})$ ions
The half cells are connected in pairs, as shown below, to form a series of galvanic cells. For each cell, the polarity of the electrodes and the voltage generated are recorded.

| half cells <br> used | positive <br> electrode | negative <br> electrode | voltage (V) |
| :---: | :---: | :---: | :---: |
| I and III | Cu | $\mathbf{Q}$ | 0.57 |
| II and III | Cu | $\mathbf{R}$ | 1.10 |
| I and II | $\mathbf{Q}$ | $\mathbf{R}$ | 0.53 |

Which one of the following lists the metals in order of increasing strength as reducing agents?

A R, Q, Cu
B $\quad \mathbf{Q}, \mathrm{Cu}, \mathbf{R}$
C $\mathrm{Cu}, \mathrm{R}, \mathrm{Q}$
D $\mathrm{Cu}, \mathbf{Q}, \mathbf{R}$

## Answer: D

In a galvanic cell the reducing agent is oxidised; oxidation occurs at the anode; the anode is the negative electrode. In each cell the stronger reducing agent is at the negative electrode.

According to the data relative strength of the reducing agents are:
For half cells:
II and IV Q > Cu;
III and IV R > Cu;
II and III R > Q
Hence, the order of increasing strength of the reducing agents is $\mathrm{Cu}<\mathbf{Q}<\mathbf{R}$

27 Some standard redox potential $\left(E^{\ominus}\right)$ values are given in the table below.

| electrode reaction | $E^{\varrho / V}$ |
| :---: | :---: |
| $\mathrm{Fe}^{3+}(\mathrm{aq})+\mathrm{e} \rightleftharpoons \mathrm{Fe}^{2+}(\mathrm{aq})$ | +0.77 |
| $\mathrm{Sn}^{4+}(\mathrm{aq})+2 \mathrm{e} \rightleftharpoons \mathrm{Sn}^{2+}(\mathrm{aq})$ | +0.15 |
| $\mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{e} \rightleftharpoons \mathrm{Ce}^{3+}(\mathrm{aq})$ | +1.45 |

Which of the following reactions would occur under standard conditions?
$1 \quad \mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{Fe}^{2+}(\mathrm{aq}) \longrightarrow \mathrm{Ce}^{3+}(\mathrm{aq})+\mathrm{Fe}^{3+}(\mathrm{aq})$
$2 \mathrm{Sn}^{2+}(\mathrm{aq})+2 \mathrm{Fe}^{3+}(\mathrm{aq}) \longrightarrow \mathrm{Sn}^{4+}(\mathrm{aq})+2 \mathrm{Fe}^{2+}(\mathrm{aq})$
$3 \quad 2 \mathrm{Ce}^{4+}(\mathrm{aq})+\mathrm{Sn}^{2+}(\mathrm{aq}) \longrightarrow 2 \mathrm{Ce}^{3+}(\mathrm{aq})+\mathrm{Sn}^{4+}(\mathrm{aq})$
A 1, 2 and 3
B 1 and 2 only
C 2 and 3 only
D 1 only

## Answer: A

Checking for reactions 1,2 and 3 :
Reaction 1: $\mathrm{E}^{\circ}{ }_{\text {cell }}=+1.45-0.77=+0.68 \mathrm{~V}$
Reaction 2: $\mathrm{E}^{\ominus}{ }_{\text {cell }}=+0.77-0.15=+0.62 \mathrm{~V}$
Reaction 3: $\mathrm{E}^{\circ}{ }_{\text {cell }}=+1.45-0.15=+1.3 \mathrm{~V}$
All the values are $>0$, hence the reactions are all spontaneous.

28 A current was passed through two cells connected in series. The first cell contained molten sodium chloride while the other contained a molten aluminium salt.

What would be the mass of aluminium liberated from the other cell if 4.6 g of sodium was liberated from the first cell?

A $\quad 0.9 \mathrm{~g}$
B $\quad 1.8 \mathrm{~g}$
C $\quad 2.7 \mathrm{~g}$
D $\quad 3.6 \mathrm{~g}$
Answer: B
Amt of electrons transferred in the two electrolytic cells is the same.
$[\mathrm{R}]: \mathrm{Na}^{+}+\mathrm{e} \rightarrow \mathrm{Na}(\mathrm{s})$
Amt of sodium $=4.6 / 23=0.2 \mathrm{~mol}$
Amt of electrons $=0.2 \mathrm{~mol}$
$[\mathrm{R}]: \mathrm{Al}^{3+}+3 \mathrm{e} \rightarrow \mathrm{Al}$ (s)
Amt of electrons transferred $=0.2 \mathrm{~mol}$
Amt of $\mathrm{Al}=0.2 / 3=0.06667 \mathrm{~mol}$

Mass of $\mathrm{Al}=0.06667 \times 27=1.8 \mathrm{~g}$

29 Which of the following does not act as a ligand in the formation of complexes?
A $\mathrm{SCN}^{-}$
B $\mathrm{Cl}^{-}$
C $\mathrm{AlH}_{4}{ }^{-}$
D $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$
Out of all the species present, $\mathrm{AlH}_{4}{ }^{-}$has no available lone pairs of electrons for donation to form a dative covalent bond as all the electrons are used for bonding.
Answer: $\mathbf{C}$

30 A reaction scheme starting from aqueous copper(II) sulfate solution is shown below. Both $\mathbf{X}$ and Y are copper-containing species.

Which of the following statements is true?
$1 \quad \mathrm{NH}_{3}$ acts as a ligand in reaction I.
2 Reaction II is a redox reaction.
3 The entropy of the system increases when reaction III occurs.
A 1 only
B 3 only
C 1 and 3 only
D 1, 2 and 3 only
In reaction $\mathrm{I}, \mathrm{NH}_{3}$ is acting as a weak base to generate $\mathrm{OH}^{-}$a to form the ppt $\mathbf{X}$. NH 3 only acts as a ligand in reaction II.

In reaction II, it is a ligand exchange reaction, hence there is no change in the oxidation state of the metal centre.
$\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}+4 \mathrm{NH}_{3} \rightleftharpoons\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}+4 \mathrm{H}_{2} \mathrm{O}$
Oxidation state of the Cu centre is still +2 .

In reaction III, edta displaces the $\mathrm{NH}_{3}$ and $\mathrm{H}_{2} \mathrm{O}$ ligands.
$\left[\mathrm{Cu}\left(\mathrm{NH}_{3}\right)_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}+$ edta $^{4-} \rightleftharpoons[\mathrm{Cu}(\mathrm{edta})]^{2-}+4 \mathrm{NH}_{3}+2 \mathrm{H}_{2} \mathrm{O}$
There is an increase in the number of particles from 2 to 7 after the reaction and hence the entropy of the system increases in reaction III.

Answer: B

Answer all the questions in the spaces provided.
1 A mixture contains two white solids $\mathrm{XCO}_{3}$ and $\mathrm{YSO}_{4}$ where $\mathbf{X}$ and Y could be either magnesium, zinc or barium. The following investigations were carried out to determine the identity of $\mathbf{X}$ and $\mathbf{Y}$.
(a) When the mixture of solids was treated with excess dilute hydrochloric acid, a colourless gas was evolved and some, but not all, of the mixture dissolved.

The resulting mixture was filtered. To the filtrate, dilute aqueous ammonia was added dropwise till in excess. The white precipitate formed was insoluble in excess aqueous ammonia.

Deduce the identity of elements $\mathbf{X}$ and $\mathbf{Y}$, showing your reasoning clearly.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b) Group 2 carbonates decompose according to the following equation:

$$
\mathrm{ZCO}_{3}(\mathrm{~s}) \longrightarrow \mathrm{ZO}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

| element | magnesium | calcium | barium |
| :--- | :---: | :---: | :---: |
| enthalpy change for the reaction, <br> $\Delta H_{\mathrm{r}} / \mathrm{kJ} \mathrm{mol}^{-1}$ | +101 | +178 | +269 |

(i) Use the data above to state and explain the trend in the thermal stability of the Group 2 carbonates.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(ii) Lithium carbonate, a Group 1 carbonate, decomposes on heating.

Use relevant data from the Data booklet to calculate relative charge densities of the above cations and hence deduce which of the above $\Delta H_{r}$ values in the table is likely to be the nearest to that of lithium carbonate.
(c) Patients with digestive tract problems are sometimes asked to take an x-ray after they have swallowed a "barium meal", consisting of a suspension of $\mathrm{BaSO}_{4}$ in water.
(i) Write an expression for the solubility product, $K_{\text {sp }}$ for $\mathrm{BaSO}_{4}$, including its units.
(ii) The numerical value of $K_{\text {sp }}$ is $1.30 \times 10^{-10}$. Calculate $\left[\mathrm{Ba}^{2+}(\mathrm{aq})\right]$ in a saturated solution of $\mathrm{BaSO}_{4}$.
(iii) Although $\mathrm{Ba}^{2+}$ ions are toxic, the $\left[\mathrm{Ba}^{2+}(\mathrm{aq})\right]$ in a saturated solution of $\mathrm{BaSO}_{4}$ is too low to cause any problems of toxicity.

The numerical value of $K_{\text {sp }}$ for $\mathrm{BaCO}_{3}\left(5 \times 10^{-10}\right)$ is not significantly higher than that of $\mathrm{BaSO}_{4}$, but $\mathrm{BaCO}_{3}$ is very poisonous if ingested. Suggest a reason why this might be so.
$\qquad$
(iv) $\mathrm{BaSO}_{4}$ is commonly prepared in the laboratory by combining aqueous solutions containing $\mathrm{Ba}^{2+}$ and $\mathrm{SO}_{4}{ }^{2-}$.

Determine if $\mathrm{BaSO}_{4}$ will form when equal volumes of $2.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$ aqueous $\mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$ and $4.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}{ }^{-3}$ aqueous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ are mixed.

2 A student conducted two separate electrolysis using inert electrodes under room temperature and pressure.

| electrolysis <br> reaction | electrolyte | volume of gas <br> collected at <br> anode $/ \mathrm{cm}^{3}$ | duration |
| :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | concentrated hydrochloric acid | 150 | 10 minutes |
| $\mathbf{2}$ | aqueous sodium sulfate | 37.5 |  |

(a) (i) Write the half-equation with state symbols for the reaction occurring at the anode for electrolysis reaction 1.
(ii) Calculate the current that was used in electrolysis reaction 1.
(b) (i) Write the half-equation with state symbols for the reaction occurring at the anode for electrolysis reaction 2.
$\qquad$
(ii) Determine the current used in electrolysis reaction 2.

3 Sertraline is an antidepressant used to treat depression, obsessive compulsive disorder, post-traumatic stress disorder and related conditions. This medication can help to improve mood, mental alertness, energy level and sleep pattern for the patients. Sertraline works by helping to restore the balance of serotonin, a neurotransmitter in the brain which regulates anxiety, mood and happiness.

A proposed synthesis route of sertraline is shown below.

(a) State the reagents and conditions needed for step 1 and draw the structure of compound $\mathbf{V}$ in the box above.
(b) Electrophilic substitution takes place in step 3 where $\mathrm{AlCl}_{3}$ acts as a Lewis acid catalyst and reacts with the acyl chloride functional group to generate the electrophile.

Write an equation to show the generation of the electrophile and hence draw the mechanism for the reaction that occurs in step 3.

(c) State the type of reaction taking place in step 4 and draw the structure of compound W in the box above.
$\qquad$
(d) Sertraline exists as a mixture of stereoisomers. Draw the structures of the stereoisomers of Sertraline.

4 (a) The change in colour from blue to pink of the cobalt complexes has been the basis of cobalt chloride indicator papers for the detection of the presence of water.

The two differently coloured cobalt(II) complex ions, $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ and $\mathrm{CoCl}_{4}{ }^{2-}$, exist together in equilibrium in solution in the presence of chloride ions. This is represented by the equation below.

$$
\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }_{6}^{2+}(\mathrm{aq})+4 \mathrm{Cl}-(\mathrm{aq}) \rightleftharpoons \mathrm{CoCl}_{4}^{2-}(\mathrm{aq})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

An experiment is conducted to investigate the effects on the equilibrium position by imposing a series of changes on the system. The shift in equilibrium position can be indicated by any colour change of the solution.

| species | colour |
| :---: | :---: |
| $\mathrm{Co}_{\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}(\mathrm{aq})}$ | pink |
| $\mathrm{CoCl}_{4}{ }^{2-}(\mathrm{aq})$ | blue |
| initial equilibrium mixture containing <br> $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ and $\mathrm{CoCl}_{4}{ }^{2-}$ | purple |

After a $3.00 \mathrm{~cm}^{3}$ sample of an initial equilibrium mixture was placed in three separate boiling tubes, a different substance was added to each tube, as indicated in Table 4.1.
(i) Complete Table 4.1 by predicting:

- the change in concentration, if any, of each ions in solution compared to the initial solution, after a new equilibrium position is reached.
- the colour change, if any, that takes place from the initial purple-coloured solution.

Table 4.1

| Substance <br> added | Change in concentration from initial <br> solution to new equilibrium <br> (increase, decrease, unchanged) |  | Colour <br> change <br> (pink, blue <br> or |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
|  | $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ | $\mathrm{Cl}^{-}$ | $\left[\mathrm{CoCl}_{4}\right]^{2-}$ |  |
| $\mathrm{H}_{2} \mathrm{O}(l)$ |  |  |  |  |
| Concentrated <br> HCl |  |  |  |  |
| $\mathrm{AgNO}_{3}(\mathrm{aq})$ |  |  |  |  |

(ii) Another experiment was conducted to investigate the effect of temperature on the same equilibrium mixture. When $3.00 \mathrm{~cm}^{3}$ of the original equilibrium mixture in a test tube was placed in an ice bath, the solution became pink.

Determine whether the forward reaction, as illustrated by the equation above, is exothermic or endothermic. Use Le Châtelier's Principle to justify your answer.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b) At room temperature, a solution of sodium tartrate, $\mathrm{Na}_{2} \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}$, does not react with hydrogen peroxide. When heated in a water bath, the reaction mixture reacts giving a very slow stream of carbon dioxide.

When a few drops of an aqueous pink cobalt(II) salt are added, the colour of the solution soon turns green and a vigorous effervescence of carbon dioxide takes place.

When the reaction stops, the pink colour is restored.
The half equation for the oxidation of tartrate ions is given as shown:

$$
\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}(\mathrm{aq})+8 \mathrm{OH}^{-}(\mathrm{aq}) \longrightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+10 \mathrm{e}^{-}
$$

(i) In alkaline medium, $\mathrm{H}_{2} \mathrm{O}_{2}$ exists as hydroperoxide ions, $\mathrm{HO}_{2}^{-}$. Construct a balanced half equation for the reduction of $\mathrm{HO}_{2}^{-}$to $\mathrm{OH}^{-}$.
(ii) Write a balanced ionic equation for the reaction between tartrate ions and hydroperoxide ions.
(iii) Suggest why there is no reaction observed when tartrate ions and hydroperoxide ions are mixed at room temperature even though the reaction is energetically feasible.
$\qquad$
$\qquad$
(iv) Explain why a slow stream of carbon dioxide is observed when reaction mixture is heated in a water bath.
$\qquad$
$\qquad$
$\qquad$
(v) State the identity of the aqueous ions responsible for the green colour.
$\qquad$
(vi) Use your answer in (b)(v) to describe the catalysed two-step reactions involving aqueous cobalt ions with the tartrate ions and hydroperoxide ions.
$\qquad$
$\qquad$
$\qquad$
$\qquad$

5 (a) Amino acids are biologically-important organic compounds containing both amine $\left(-\mathrm{NH}_{2}\right)$ and carboxylic acid ( -COOH ) functional groups.

To consider the effect of having both an amine and a carboxylic acid functional group on the same molecule, amino acids can be compared with other organic compounds such as diamines and dicarboxylic acids.

Amino acids have significantly higher melting points than diamines and dicarboxylic acids of similar mass and structure as shown in Table 5.1 below.

Table 5.1

| compound type | example | molar mass $/ \mathrm{g} \mathrm{mol}^{-1}$ | melting point $/{ }^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: | :---: |
| diamine |  | 116.2 | 39 |
| dicarboxylic acid |  <br> methylpropanedioic acid | 118.1 | 184 |
| amino acid |  <br> 2-amino-3-methylbutanoic acid (valine) | 117.2 | 298 |

Explain why the melting points show an increasing trend from diamine to amino acid in terms of structure and bonding.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b) When $50.0 \mathrm{~cm}^{3}$ of hexane was shaken with $20.0 \mathrm{~cm}^{3}$ of an aqueous solution containing 1.10 g of 2-amino-3-methylbutanoic acid (valine), it was found that 0.050 g of valine was extracted into the hexane. At equilibrium, the ratio of the concentration of valine in the two immiscible solvents is a constant called partition coefficient where

$$
K_{\text {partition }}=\frac{[\text { valine }]_{\text {hexane }}}{[\text { valine }]_{\mathrm{aq}}}
$$

(i) Calculate the partition coefficient, $K_{\text {partition, }}$ of valine between hexane and water.
(ii) State which is a better solvent for valine and explain the reason for its solubility in that solvent.
$\qquad$
$\qquad$
(c) Tryptophan is an essential amino acid found in foods such as chicken, eggs, cheese and milk. It is needed to create the neurotransmitter serotonin which promotes sleep. Two amino acids, tyrosine (tyr) and tryptophan (trp), form a dipeptide, tyr-trp, as shown by the following structure.

tyr-trp

Draw the structures of the products of the reactions of tyr-trp with an excess of each of the following reagents.
(i) $\mathrm{NaOH}(\mathrm{aq})$ at room temperature

[1]
(ii) $\mathrm{HCl}(\mathrm{aq})$ and heat under reflux

(d) Phenylalanine and tyrosine form another dipeptide (phe-tyr) as shown below

phe-tyr
A mixture of the dipeptide (phe-tyr) and its two constituent amino acids (phenylalanine and tyrosine) was subjected to electrophoresis in a buffer at pH 12. At the end of the experiment the following results were seen. Spots $\mathbf{R}$ and $\mathbf{S}$ remained very close together.

The three spots are due to the three species phenylalanine, tyrosine and the dipeptide, phe-tyr.
(i) Draw the structural formula of the species responsible for spot $\mathbf{P}$.
(ii) Suggest why the other two species give spots $\mathbf{R}$ and $\mathbf{S}$ that are so close together.
$\qquad$
$\qquad$

6 In an isolated transition metal atom, the five 3d-orbitals are degenerate. However, in an octahedral complex ion, the presence of ligands splits the five orbitals into a group of three and a group of two. These two groups have slightly different energies.
(a) Using the axes provided below, draw and label the shape of one d-orbital in each of the two groups mentioned above.

(b) Explain how the presence of the six ligands, $\mathbf{L}$, in $\left[\mathrm{NiL}_{6}\right]^{2+}$ splits the five 3d orbitals into two groups of different energy, and explain whether the two-orbital group or the three-orbital group has the higher energy.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(c) The absorbance spectra of solutions of two transition metal complexes $\mathbf{J}$ and $\mathbf{K}$ are shown in the diagram below.

A list of possible colours for these complexes is as follows.
yellow
red
green
blue

Choose one of the colours above to describe the observed colour of each solution.

Solution J
Solution K $\qquad$
(d) Ligands are classified based on their ability to split the five 3d orbitals into two groups with an energy difference $(\Delta \mathrm{E})$. Strong field ligands produce a large $\Delta \mathrm{E}$ while weak field ligands produce a small $\Delta \mathrm{E}$.

The energy of a photon can be obtained by Planck's equation:

$$
\mathrm{E}=\frac{h c}{\lambda}
$$

where: E is the energy of the photon (in J)
$\lambda$ is the wavelength of the photon (in m )
$h$ is Planck's constant
$c$ is the speed of light in vacuum
Use the data below as well as data from the Data Booklet, complete the table and arrange the ligands in order of increasing field strength.

| species | $\left[\mathrm{M}(\mathrm{CN})_{6}\right]^{2-}$ | $\left[\mathrm{M}(\mathrm{F})_{6}\right]^{4-}$ | $\left[\mathrm{M}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ |
| :---: | :---: | :---: | :---: |
| $\lambda / \mathrm{nm}$ | 430 | 650 | 600 |
| $\Delta \mathrm{E} / \mathrm{J}$ |  |  |  |

Increasing field strength: $\qquad$ < $\qquad$ $<$

7 The oxidising power of our atmosphere has been well-studied and is of importance as many environmental trace gases, such as methane, are removed.

The most abundant oxidants in the atmosphere are oxygen and ozone molecules. These molecules have strong bonds and are hence relatively unreactive except towards radicals. Research in the 1950s suggested that the hydroxyl radical, $\bullet \mathrm{OH}$, is a strong oxidant.

In the stratosphere, UV light from the sun heterolytically breaks ozone molecules into oxygen molecules and oxygen atoms. The oxygen atoms react homolytically with water vapour to produce hydroxyl radicals, $\bullet \mathrm{OH}$.

$$
\begin{gather*}
\mathrm{O}_{3} \xrightarrow{\mathrm{UV}} \mathrm{O}_{2}+\mathrm{O}  \tag{1}\\
\mathrm{O}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \cdot \mathrm{OH} \tag{2}
\end{gather*}
$$

(a) Use equations (1) and (2) to draw the mechanism for the formation of the hydroxyl radical, $\bullet \mathrm{OH}$. Include in your mechanism the necessary curly arrows and electrons.

(b) Hydroxyl radicals are particularly reactive towards H -containing molecules due to H -abstraction converting $\cdot \mathrm{OH}$ back to $\mathrm{H}_{2} \mathrm{O}$.

$$
\begin{equation*}
\cdot \mathrm{OH}+\mathrm{CH}_{4} \rightarrow \mathrm{H}_{2} \mathrm{O}+\cdot \mathrm{CH}_{3} \tag{3}
\end{equation*}
$$

Some information about an elementary reaction (3) was obtained.

| $[\cdot \mathrm{OH}] /$ molecules $\mathrm{cm}^{-3}$ | $1.0 \times 10^{6}$ |
| :--- | :---: |
| $\left[\mathrm{CH}_{4}\right] /$ molecules cm |  |
| rate constant, $\mathrm{k} / \mathrm{cm}^{3}$ molecule $^{-1} \mathrm{~s}^{-1}$ | $4.4 \times 10^{13}$ |
| res | $1.4 \times 10^{-5}$ |

Source: Jacob, D. J. Introduction to Atmospheric Chemistry; Princeton University Press: 1999
(i) Use information in the table to write an equation to represent the rate equation for the pseudo-first-order reaction with respect to the concentration of the hydroxyl radical, $\bullet \mathrm{OH}$.
(ii) Calculate the half-life of the hydroxyl radical, $\cdot \mathrm{OH}$ to the nearest 2 significant figures.
(c) The relative rates of disappearance in air at 305 K for a series of hydrocarbons were measured in an environmental chamber under simulated atmospheric conditions. Absolute rate constants obtained from the reaction are as follows.

| hydrocarbon | $\mathrm{k} / \times 10^{9} \mathrm{~mol}^{-1} \mathrm{dm}^{3} \mathrm{~s}^{-1}$ |
| :---: | :---: |
| butane | 1.8 |
| hexane | 3.8 |
| cis-but-2-ene | 39.2 |

Source: J. Phys. Chem. 80, 8, 789-794
(i) Use the information given in (b) and refer to the bonding within butane and hexane to suggest a reason for the difference in their reactivity.
$\qquad$
$\qquad$
(ii) The reaction between hydroxyl radicals and alkenes proceed via a different mechanism and this increases the rate of reaction.

Account for this difference referring to the terms 'sigma' and 'pi'.
$\qquad$
$\qquad$
$\qquad$

After the attack of the hydroxyl radical on cis-but-2-ene, the intermediate is now reactive enough to react with molecular oxygen.
(iii) Complete the diagram to suggest a mechanism to show how the hydroxyperoxyl radical is formed. Show the movement of electrons by using curly arrows.

(d) Alkenes can also react with ozone directly via a process known as ozonolysis and the first step produces a carbonyl oxide and a carbonyl compound. Quenching with dimethyl sulfide produces two carbonyl compounds.

Complete the reaction scheme below.

1. $\mathrm{O}_{3}$
2. $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{~S}$

[Total: 12]

Answer all the questions in the spaces provided.
1 A mixture contains two white solids $\mathrm{XCO}_{3}$ and $\mathrm{YSO}_{4}$ where $\mathbf{X}$ and $\mathbf{Y}$ could be either magnesium, zinc or barium. The following investigations were carried out to determine the identity of $\mathbf{X}$ and $\mathbf{Y}$.
(a) When the mixture of solids was treated with excess dilute hydrochloric acid, a colourless gas was evolved and some, but not all, of the mixture dissolved.

The resulting mixture was filtered. To the filtrate, dilute aqueous ammonia was added dropwise till in excess. The white precipitate formed was insoluble in excess aqueous ammonia.

Deduce the identity of elements $\mathbf{X}$ and $\mathbf{Y}$, showing your reasoning clearly.

- X-Mg Y - Ba
- $\mathrm{BaSO}_{4}$ insoluble in dil HCI ,
- filtrate contains $\mathbf{M g}^{2+}$ which ppt to form $\left.\mathbf{M g ( O H}\right)_{2}$ white ppt insol in excess aq ammonia
OR
- White ppt contains $\mathbf{M g}^{\mathbf{2 +}}$ as $\mathbf{Z n}^{\mathbf{2 +}}$ forms ppt but it is soluble in excess $\mathbf{N H}_{3}$
(b) Group 2 carbonates decompose according to the following equation:

$$
\mathrm{ZCO}_{3}(\mathrm{~s}) \longrightarrow \mathrm{ZO}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

| element | magnesium | calcium | barium |
| :--- | :---: | :---: | :---: |
| enthalpy change for the reaction, <br> $\Delta H_{r} / \mathrm{kJ} \mathrm{mol}^{-1}$ | +101 | +178 | +269 |

(i) Use the data above to state and explain the trend in the thermal stability of the Group 2 carbonates.

- $\Delta \mathbf{H}_{r}$ become more endo, thermal stability increases
- increasing ionic radii leading to decreasing charge density/ polarising power and
- less distortion of electron cloud of large anion
(ii) Lithium carbonate, a Group 1 carbonate, decomposes on heating.

Use relevant data from the Data booklet to calculate relative charge densities of the above cations and hence deduce which of the above $\Delta \mathbf{H}_{r}$ values in the table is likely to be the nearest to that of lithium carbonate.

|  | $\mathrm{Mg}^{2+}$ | $\mathrm{Ca}^{2+}$ | $\mathrm{Ba}^{2+}$ | $\mathrm{Li}^{+}$ |
| :--- | :--- | :--- | :--- | :--- |
| Relative charge <br> density | $2 / 0.065$ | $2 / 0.099$ | $2 / 0.135$ | $1 / 0.06$ |
| $=30.8$ | $=20.2$ | $=14.8$ | $=16.7$ |  |

## $\Delta \mathrm{H}_{r}$ of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ resembles that of $\mathrm{BaCO}_{3}$

(c) Patients with digestive tract problems are sometimes asked to take an x-ray after they have swallowed a "barium meal", consisting of a suspension of $\mathrm{BaSO}_{4}$ in water.
(i) Write an expression for the solubility product, $K_{\text {sp }}$, for $\mathrm{BaSO}_{4}$, including its units.

$$
\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ba}^{2+}\right]\left[\mathrm{SO}_{4}{ }^{2-}\right] \quad \text { units: } \mathrm{mol}^{2} \mathrm{dm}^{-6}
$$

(ii) The numerical value of $K_{\text {sp }}$ is $1.30 \times 10^{-10}$. Calculate $\left[\mathrm{Ba}^{2+}(\mathrm{aq})\right]$ in a saturated solution of $\mathrm{BaSO}_{4}$.

In saturated solution, $\mathrm{IP}=\mathrm{K}_{\text {sp }}$ $\left[\mathrm{Ba}^{2+}\right]=\sqrt{ } 1.30 \times 10^{-10}=1.14 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$
(iii) Although $\mathrm{Ba}^{2+}$ ions are toxic, the $\left[\mathrm{Ba}^{2+}(\mathrm{aq})\right]$ in a saturated solution of $\mathrm{BaSO}_{4}$ is too low to cause any problems of toxicity.

The numerical value of $K_{\text {sp }}$ for $\mathrm{BaCO}_{3}\left(5 \times 10^{-10}\right)$ is not significantly higher than that of $\mathrm{BaSO}_{4}$, but $\mathrm{BaCO}_{3}$ is very poisonous if ingested. Suggest a reason why this might be so.

## $\mathrm{BaCO}_{3}$ reacts with the acid in the stomach to release $\mathrm{Ba}^{2+}$ ions.

(iv) $\mathrm{BaSO}_{4}$ is commonly prepared in the laboratory by combining solutions containing $\mathrm{Ba}^{2+}$ and $\mathrm{SO}_{4}{ }^{2-}$.

Determine if $\mathrm{BaSO}_{4}$ will form when equal volumes of $2.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$ $\mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}$ and $4.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{Na}_{2} \mathrm{SO}_{4}$ are mixed.
$\left[\mathrm{Ba}^{2+}\right]$ after mixing $=1.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
[ $\mathrm{SO}_{4}{ }^{2}$ ] after mixing $=2.00 \times 10^{-2} \mathrm{~mol} \mathrm{dm}^{-3}$
IP on mixing $=2.00 \times 10^{-4}>K_{\text {sp }}\left(1.14 \times 10^{-10}\right)$
Hence precipitation will take place.

2 A student conducted two separate electrolysis using inert electrodes under room temperature and pressure.

| electrolysis <br> reaction | electrolyte | volume of gas <br> collected at <br> anode $/ \mathrm{cm}^{3}$ | duration |
| :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | concentrated hydrochloric acid | 150 | 10 minutes |
| $\mathbf{2}$ | aqueous sodium sulfate | 37.5 |  |

(a) (i) Write the half-equation with state symbols for the reaction occurring at the anode for electrolysis reaction 1.
$2 \mathrm{Cl}^{-}(\mathrm{aq}) \rightarrow \mathrm{Cl}_{2} \mathbf{( g )}+\mathbf{2 e}^{-}$
(ii) Calculate the current that was used in electrolysis reaction 1.

Amt of $\mathrm{Cl}_{2}$ collected $=150 / 24000=6.25 \times 10^{-3} \mathrm{~mol}$
Amt of electrons passed through $=6.25 \times 10^{-3} \times 2=0.0125 \mathrm{~mol}$
Quantity of charge passed through $=0.0125 \times 96500=1206.25 \mathrm{C}$
Current used $=1206.25 /(10 \times 60)=2.01 \mathrm{~A}$
(b) (i) Write the half-equation with state symbols for the reaction occurring at the anode for electrolysis reaction 2.
$2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{O}_{2}(\mathrm{~g})+4 \mathrm{H}^{+}(\mathrm{aq})+4 \mathrm{e}^{-}$
(ii) Determine the current used in electrolysis reaction 2.

If the current used was the same, the volume of gas obtained in reaction should be halved based on the number of e-required. Since the volume of gas is four times less than that in reaction 1, the current used must be halved.

Current used $=1 / 2 \times 2.01=1.005=1.01 \mathrm{~A}$
[Total: 6]

3 Sertraline is an antidepressant used to treat depression, obsessive compulsive disorder, post-traumatic stress disorder and related conditions. This medication can help to improve mood, mental alertness, energy level and sleep pattern for the patients. Sertraline works by helping to restore the balance of serotonin, a neurotransmitter in the brain which regulates anxiety, mood and happiness.

A proposed synthesis route of sertraline is shown below.

(a) State the reagents and conditions needed for step 1 and draw the structure of compound $\mathbf{V}$ in the box above.

## $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$, dilute $\mathrm{H}_{2} \mathrm{SO}_{4}$, heat under reflux

(b) Electrophilic substitution takes place in step 3 where $\mathrm{AlCl}_{3}$ acts as a Lewis acid catalyst and reacts with the acyl chloride functional group to generate the electrophile.

Write an equation to show the generation of the electrophile and hence draw the mechanism for the reaction that occurs in step 3.

You may use R to represent

in Sertraline for part (b) and part (d).

$+\mathrm{AlCl}_{3}+\mathrm{HCl}$
(c) State the type of reaction taking place in step 4 and draw the structure of compound $\mathbf{W}$ in the box above.

## Condensation

(d) Sertraline exists as a mixture of stereoisomers. Draw the structures of the stereoisomers of Sertraline.

[Total: 9]
4 (a) The change in colour from blue to pink of the cobalt complexes has been the basis of cobalt chloride indicator papers for the detection of the presence of water.

The two differently coloured cobalt(II) complex ions, $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ and $\mathrm{CoCl}_{4}{ }^{2-}$, exist together in equilibrium in solution in the presence of chloride ions. This is represented by the equation below.

$$
\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}(\mathrm{aq})+4 \mathrm{Cl}^{-}(\mathrm{aq}) \rightleftharpoons \mathrm{CoCl}_{4}{ }^{2-}(\mathrm{aq})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

An experiment is conducted to investigate the effects on the equilibrium position by imposing a series of changes on the system. The shift in equilibrium position can be indicated by any colour change of the solution.

| species | colour |
| :---: | :---: |
| $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}(\mathrm{aq})$ | pink |
| $\mathrm{CoCl}_{4}{ }^{2-}(\mathrm{aq})$ | blue |
| initial equilibrium mixture containing <br> $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ and $\mathrm{CoCl}_{4}{ }^{2-}$ | purple |

After a $3.00 \mathrm{~cm}^{3}$ sample of an initial equilibrium mixture was placed in three separate boiling tubes, a different substance was added to each tube, as indicated in Table 4.1.
(i) Complete Table 4.1 by predicting:

- the change in concentration, if any, of each ions in solution compared to the initial solution, after a new equilibrium position is reached.
- the colour change, if any, that takes place from the initial purple-coloured solution.

Table 4.1

| Substance added | Change in concentration from initial <br> solution to new equilibrium <br> (increase, decrease, unchanged) |  | Colour <br> change <br> (pink, blue or <br> unchanged) |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ | $\mathrm{Cl}^{-}$ | $\left[\mathrm{CoCl}_{4}\right]^{2-}$ |  |
|  |  |  |  |  |
| Concentrated HCl |  |  |  |  |

| $\mathrm{AgNO}_{3}(\mathrm{aq})$ |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |

[3]

| Substance <br> added | Change in concentration from initial <br> equilibrium to final equilibrium <br> (increase, decrease, unchanged) |  | Colour <br> favoured <br> (pink, blue <br> or |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\left[\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}_{6}\right]^{2+}\right.$ | $\mathrm{Cl}^{-}$ | $[\mathrm{CoCl}]^{2-}$ |  |
| unchanged) |  |  |  |  |$|$

(ii) Another experiment was conducted to investigate the effect of temperature on the same equilibrium mixture. When $3.00 \mathrm{~cm}^{3}$ of the original equilibrium mixture in a test tube was placed in an ice bath, the solution became pink.

Determine whether the forward reaction, as illustrated by the equation above, is exothermic or endothermic. Use Le Châtelier's Principle to justify your answer.

A decrease in temperature shifts position of equilibrium to the left (pink colour) and a decrease in temperature favours exothermic reaction to release heat.

Hence the reverse reaction is exothermic and the forward reaction is endothermic.
(b) At room temperature, a solution of sodium tartrate, $\mathrm{Na}_{2} \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}$, does not react with hydrogen peroxide. When heated in a water bath, the reaction mixture reacts giving a very slow stream of carbon dioxide.

When a few drops of an aqueous pink cobalt(II) salt are added, the colour of the solution soon turns green and a vigorous effervescence of carbon dioxide takes place.

When the reaction stops, the pink colour is restored.
The half equation for the oxidation of tartrate ions is given as shown:

$$
\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}^{2-}(\mathrm{aq})+8 \mathrm{OH}^{-}(\mathrm{aq}) \longrightarrow 4 \mathrm{CO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+10 \mathrm{e}^{-}
$$

(i) In alkaline medium, $\mathrm{H}_{2} \mathrm{O}_{2}$ exists as hydroperoxide ions, $\mathrm{HO}_{2}^{-}$. Construct a balanced half equation for the reduction of $\mathrm{HO}_{2}^{-}$to $\mathrm{OH}^{-}$.
$\mathrm{HO}_{2}^{-}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}^{-} \rightarrow 3 \mathrm{OH}^{-}$
(ii) Write a balanced ionic equation for the reaction between tartrate ions and hydroperoxide ions.

Oxidation half-equation
$\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}+8 \mathrm{OH}^{-} \rightarrow 4 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}+10 \mathrm{e}^{-}$

## Reduction half-equation

$\mathrm{HO}_{2}^{-}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{e}^{-} \rightarrow 3 \mathrm{OH}^{-}$
Balanced eqn:
$\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}+5 \mathrm{HO}_{2}{ }^{-} \rightarrow 4 \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}+7 \mathrm{OH}^{-}$
(iii) Suggest why there is no reaction observed when tartrate ions and hydroperoxide ions are mixed at room temperature even though the reaction is energetically feasible.

The activation energy is high due to electrostatic repulsion between the two negatively charged ions.
(iv) Explain why a slow stream of carbon dioxide is observed when reaction mixture is heated in a water bath.

As temperature increases, more particles have energy more than or equal to the activation energy and hence frequency of effective collision increases and rate increases.
(v) State the identity of the aqueous ions responsible for the green colour.

Aqueous cobalt (III) ions
(vi) Use your answer in (b)(v) to describe the catalysed two-step reactions involving aqueous cobalt ions with the tartrate ions and hydroperoxide ions.

## New mechanism:

Step 1- pink cobalt(II) ions is oxidised by hydroperoxide ions to green cobalt(III) ions

Step 2-green cobalt(III) ions are reduced by tartrate ions back to pink cobalt(II) ions, thus regenerating the catalyst.

Or
Step 1
$2 \mathrm{Co}^{2+}+\mathrm{HO}_{2}^{-}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{Co}^{3+}+3 \mathrm{OH}^{-}$
Step 2
$\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}+8 \mathrm{OH}^{-}+10 \mathrm{Co}^{3+} \rightarrow 4 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}+10 \mathrm{Co}^{2+}$

5 (a) Amino acids are biologically-important organic compounds containing both amine $\left(-\mathrm{NH}_{2}\right)$ and carboxylic acid ( -COOH ) functional groups.

To consider the effect of having both an amine and a carboxylic acid functional group on the same molecule, amino acids can be compared with other organic compounds such as diamines and dicarboxylic acids.

Amino acids have significantly higher melting points than diamines and dicarboxylic acids of similar mass and structure as shown in Table 5.1 below.

Table 5.1

| compound type | example | molar mass $/ \mathrm{g} \mathrm{mol}^{-1}$ | melting point $/{ }^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: | :---: |
| diamine |  <br> hexane-1,1-diamine | 116.2 | 39 |
| dicarboxylic acid |  <br> methylpropanedioic acid | 118.1 | 184 |
| amino acid |  <br> 2-amino-3-methylbutanoic acid (valine) | 117.2 | 298 |

Explain why the melting points show an increasing trend from diamine to amino acid in terms of structure and bonding.

Diamine and dicarboxylic acid have simple molecular structures with hydrogen bonds between polar molecules.

Dicarboxylic acid has stronger hydrogen bonds than diamine as O-H bond is more polarised and has more extensive hydrogen bonds than diamines.

Hence more energy is needed to break hydrogen bonds in dicarboxylic acid than in diamine, hence it has higher m.p.

Valine has a giant ionic lattice with strong electrostatic forces of attraction( or ionic-bonds) between the zwitterions.

More energy is needed to break stronger ionic bonds compared to hydrogen bonds, hence it has the highest m.p.
(b) When $50.0 \mathrm{~cm}^{3}$ of hexane was shaken with $20.0 \mathrm{~cm}^{3}$ of an aqueous solution containing 1.10 g of 2 -amino-3-methylbutanoic acid (valine), it was found that 0.050 g of valine was extracted into the hexane. At equilibrium, the ratio of the concentration of valine in the two immiscible solvents is a constant called partition coefficient where

$$
K_{\text {partition }}=\frac{[\text { valine }]_{\text {hexane }}}{[\text { valine }]_{\text {aq }}}
$$

(i) Calculate the partition coefficient, $K_{\text {partition, }}$ of valine between hexane and water.

$$
\begin{aligned}
\mathrm{K}_{\text {partition }} & =[\text { valine }]_{\text {nexane }} /[\text { valine }]_{\mathrm{aq}} \\
& =(0.05 / 50) /(1.05 / 20)=0.0190
\end{aligned}
$$

(ii) State which is a better solvent for valine and explain the reason for its solubility in that solvent.

Water is a better solvent as valine exists as zwitterion and forms ion-dipole interactions with water.
(c) Tryptophan is an essential amino acid found in foods such as chicken, eggs, cheese and milk. It is needed to create the neurotransmitter serotonin which promotes sleep. Two amino acids, tyrosine (tyr) and tryptophan (trp), form a dipeptide, tyr-trp, as shown by the following structure.

tyr-trp

Draw the structures of the products of the reactions of tyr-trp with an excess of each of the following reagents.
(i) $\mathrm{NaOH}(\mathrm{aq})$ at room temperature

(ii) $\mathrm{HCl}(\mathrm{aq})$ and heat under reflux

(d) Phenylalanine and tyrosine form another dipeptide (phe-tyr) as shown below.

phe-tyr
A mixture of the dipeptide (phe-tyr) and its two constituent amino acids (phenylalanine and tyrosine) was subjected to electrophoresis in a buffer at pH 12. At the end of the experiment the following results were seen. Spots $\mathbf{R}$ and $\mathbf{S}$ remained very close together.

The three spots are due to the three species phenylalanine, tyrosine and the dipeptide, phe-tyr.
(i) Draw the structural formula of the species responsible for spot $\mathbf{P}$.

(ii) Suggest why the other two species give spots $\mathbf{R}$ and $\mathbf{S}$ that are so close together.
dipeptide / phe-tyr) has 2- and its $M_{r}$ is about double that of phe with 1 OR
charge / mass ratios are about the same for the dipeptide (phe-tyr) and phe
[Total: 12]

6 In an isolated transition metal atom, the five 3d-orbitals are degenerate. However, in an octahedral complex ion, the presence of ligands splits the five orbitals into a group of three and a group of two. These two groups have slightly different energies.
(a) Using the axes provided below, draw and label the shape of one d-orbital in each of the two groups mentioned above.

(b) Explain how the presence of the six ligands, L , in $\left[\mathrm{NiL}_{6}\right]^{2+}$ splits the five 3d orbitals into two groups of different energy, and explain whether the two-orbital group or the threeorbital group has the higher energy.

Ligands have lone pairs of electrons and they approach the metal ion along the primary axes.

The d electrons in the orbitals pointing towards the ligands experience repulsion and hence of a higher energy level.

Since the $d\left(x^{2}-y^{2}\right)$ and $d z^{2}$ orbitals point towards the ligands, the two-orbital group is higher in energy.
(c) The absorbance spectra of solutions of two transition metal complexes $\mathbf{J}$ and $\mathbf{K}$ are shown in the diagram below.

A list of possible colours for these complexes is as follows.
yellow red green blue
Choose one of the colours above to describe the observed colour of each solution.
Solution J $\qquad$ Solution K

## Solution J red

## Solution K blue

(d) Ligands are classified based on their ability to split the five 3d orbitals into two groups with an energy difference $(\Delta \mathrm{E})$. Strong field ligands produce a large $\Delta \mathrm{E}$ while weak field ligands produce a small $\Delta E$.

The energy of a photon can be obtained by Planck's equation:

$$
\mathrm{E}=\frac{h c}{\lambda}
$$

where:
$E$ is the energy of the photon
$\lambda$ is the wavelength of the photon
$h$ is Planck's constant
$c$ is the speed of light in vacuum
Use the data below as well as data from the Data Booklet, complete the table and arrange the ligands in order of increasing field strength.

| species | $\left[\mathrm{M}(\mathrm{CN})_{6}\right]^{2-}$ | $\left[\mathrm{M}(\mathrm{F})_{6}\right]^{4-}$ | $\left[\mathrm{M}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ |
| :---: | :---: | :---: | :---: |
| $\lambda / \mathrm{nm}$ | 430 | 650 | 600 |
| $\Delta \mathrm{E} / \mathrm{J}$ |  |  |  |

Increasing field strength: $\qquad$ <. $<$

| species | $\left[M(\mathrm{CN})_{6}\right]^{2-}$ | $\left[M(\mathrm{~F})_{6}\right]^{4-}$ | $\left[M\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]^{2+}$ |
| :--- | :---: | :---: | :---: |
| $\lambda / \mathrm{nm}$ | 430 | 650 | 600 |
| $\Delta E / J$ | $4.63 \times 10^{-19}$ | $3.06 \times 10^{-19}$ | $3.32 \times 10^{-19}$ |

Increasing field strength: $\mathrm{F}^{-}<\mathrm{H}_{2} \mathrm{O}<\mathrm{CN}^{-}$
[Total: 9]
7 The oxidising power of our atmosphere has been well-studied and is of importance as many environmental trace gases, such as methane, are removed.

The most abundant oxidants in the atmosphere are oxygen and ozone molecules. These molecules have strong bonds and are hence relatively unreactive except towards radicals. Research in the 1950s suggested that the hydroxyl radical, $\bullet \mathrm{OH}$, is a strong oxidant.

In the stratosphere, UV light from the sun heterolytically breaks ozone molecules into oxygen molecules and oxygen atoms. The oxygen atoms react homolytically with water vapour to produce hydroxyl radicals, $\bullet \mathrm{OH}$.

$$
\begin{gather*}
\mathrm{O}_{3} \xrightarrow{\mathrm{UV}} \mathrm{O}_{2}+\mathrm{O}  \tag{1}\\
\mathrm{O}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \cdot \mathrm{OH} \tag{2}
\end{gather*}
$$

(a) Use equations (1) and (2) to draw the mechanism for the formation of the hydroxyl radical, $\cdot \mathrm{OH}$. Include in your mechanism the necessary curly arrows and electrons. [2]

(b) Hydroxyl radicals are particularly reactive towards H -containing molecules due to H -abstraction converting $\cdot \mathrm{OH}$ back to $\mathrm{H}_{2} \mathrm{O}$.

$$
\begin{equation*}
\cdot \mathrm{OH}+\mathrm{CH}_{4} \rightarrow \mathrm{H}_{2} \mathrm{O}+\cdot \mathrm{CH}_{3} \tag{3}
\end{equation*}
$$

Some information about an elementary reaction (3) was obtained.

| $[\cdot \mathrm{OH}] /$ molecules $\mathrm{cm}^{-3}$ | $1.0 \times 10^{6}$ |
| :--- | :--- |
| $\left[\mathrm{CH}_{4}\right] /$ molecules $\mathrm{cm}^{-3}$ | $4.4 \times 10^{13}$ |
| rate constant, $\mathrm{k} / \mathrm{cm}^{3}$ molecule $^{-1} \mathrm{~s}^{-1}$ | $1.4 \times 10^{-5}$ |

Source: Jacob, D. J. Introduction to Atmospheric Chemistry; Princeton University Press: 1999
(i) Use information in the table to write an equation to represent the rate equation for the pseudo-first-order reaction with respect to the concentration of the hydroxyl radical, $\bullet \mathrm{OH}$.
rate $=\mathrm{k}^{\prime}[\cdot \mathrm{OH}]$
(ii) Calculate the half-life of the hydroxyl radical, $\cdot \mathrm{OH}$ to the nearest 2 significant figures.
rate $=k^{\prime}[\cdot \mathrm{OH}], k^{\prime}=k\left[\mathrm{CH}_{4}\right]$

$$
\begin{aligned}
& \mathrm{k}^{\prime}=1.4 \times 10^{-5} \times 4.4 \times 10^{13}=6.16 \times 10^{8} \mathrm{~s}^{-1} \\
& \mathbf{t}_{1 / 2}=\frac{\ln 2}{k^{\prime}}=\frac{\ln 2}{6.16 \times 10^{8}}=1.1 \times 10^{-9} \mathrm{~s}
\end{aligned}
$$

(c) The relative rates of disappearance in air at 305 K for a series of hydrocarbons were measured in an environmental chamber under simulated atmospheric conditions. Absolute rate constants obtained from the reaction are as follows.

| hydrocarbon | $\mathrm{k} / \times 10^{9} \mathrm{~mol}^{-1} \mathrm{dm}^{3} \mathrm{~s}^{-1}$ |
| :---: | :---: |
| butane | 1.8 |
| hexane | 3.8 |
| cis-but-2-ene | 39.2 |

Source: J. Phys. Chem. 80, 8, 789-794
(i) Use the information given in (b) and refer to the bonding within butane and hexane to suggest a reason for the difference in their reactivity.

## There are more $\mathrm{C}-\mathrm{H}$ bonds in hexane than butane, leading to a faster rate of H -abstraction.

(ii) The reaction between hydroxyl radicals and alkenes proceed via a different mechanism and this increases the rate of reaction.

Account for this difference referring to the terms 'sigma' and 'pi'.
The pi electrons in the alkene $\mathbf{C =} \mathbf{C}$ bond are less tightly bound to the nucleus
OR
weaker as compared to the sigma electrons in the $\mathrm{C}-\mathrm{H}$ bond and hence reaction with alkenes proceed faster.

After the attack of the hydroxyl radical on cis-but-2-ene, the intermediate is now reactive enough to react with molecular oxygen.
(iii) Complete the diagram to suggest a mechanism to show how the hydroxyperoxyl radical is formed. Show the movement of electrons by using curly arrows.

(d) Alkenes can also react with ozone directly via a process known as ozonolysis and the first step produces a carbonyl oxide and a carbonyl compound. Quenching with dimethyl sulfide produces two carbonyl compounds.

Complete the reaction scheme below.

[3]

[Total: 12]

## BLANK PAGE

## Section A

Answer all questions in this section.
1 (a) (i) Due to reactivity of $\mathrm{AlCl}_{3}$ and $\mathrm{PCl}_{5}$ in water, the following reactions are carried out under anhydrous conditions.

Write equations showing the reactions of aluminium chloride and phosphorus pentachloride in water. State the pH of resulting solutions.
(ii) Chlorobenzene and 2-chloro-2-methylbutane are separately boiled with aqueous sodium hydroxide and acidified with nitric acid before aqueous silver nitrate is added.

State and explain the difference in observations. Write equations for the reactions that occur.
(b) To study the kinetics of the reaction between 2-chloro-2-methylbutane and sodium hydroxide in alcoholic medium, two experiments with different initial concentrations of 2-chloro-2-methylbutane were carried out at constant temperature.
$\mathrm{A}[\mathrm{NaOH}]$-time graph was plotted using the results obtained from the experiments.

(i) Deduce the orders of reaction with respect to 2-chloro-2-methylbutane and NaOH .
(ii) Hence state the rate equation of this reaction.
(iii) The proposed mechanism of 2-chloro-2-methylbutane with alcoholic sodium hydroxide is given below.

Using your answer in (b)(ii) and the above steps, suggest the complete mechanism by

- drawing curly arrows,
- showing lone pair(s) of electrons and
- identifying the slow step.
(c) Chlorobenzene has the following resonance structures which represent the alternative distribution of electrons on the molecule. Using these structures, suggest why the electrophilic substitution of chlorobenzene is 2,4 -directing.

(d) When butane is reacted with chlorine gas under strong UV rays, a mixture of compounds is formed.
(i) Assuming that primary and secondary hydrogen atoms have similar reactivity, draw the structures of alkyl radicals formed during the reaction and state their likely ratio of formation.
(ii) During the termination stage, the alkyl radicals in (d)(i) form three structures with the molecular formula $\mathrm{C}_{8} \mathrm{H}_{18}$. Suggest their structures and the ratio of these structures.
(e) Chlorofluoroalkanes, CFCs, were once used as refrigerant fluids and aerosol propellants. In many applications, they have now been replaced by alkanes. This is because CFCs contribute to the destruction of the ozone layer.
(i) Suggest one reason why CFCs were originally used for this purpose.
(ii) Suggest one potential hazard of using alkanes instead of CFCs.
[Total: 22]

2 Recreational drugs like methamphetamine and methcathinone can be synthesised easily from pseudoephedrine, a common nasal decongestant found in cough medicine.

HI, followed by neutralisation
(a) (i) The structures of methcathinone and methamphetamine, with $\mathrm{p} K_{\mathrm{b}}$ values at 298 K , are shown in the table below.
(s)

Explain why methcathinone has a higher $\mathrm{p} K_{\mathrm{b}}$ value than methamphetamine.
(ii) Suggest the structure of intermediate $\mathbf{X}$.
(b) Commercially, methcathinone is sold in its salt form as solid methcathinone hydrochloride.

Methcathinone hydrochloride undergoes the following reaction to form a possible analogue, $\mathbf{Y}$, with hallucinogenic properties.

Name the type of reaction and describe its mechanism, showing curly arrows, charges and any relevant lone pairs.
(c) Hydrogen iodide, HI , is listed as a controlled substance as it is often used illegally to produce popular recreational drugs like methamphetamine.

The commercial preparation of hydrogen iodide, HI , involves the reaction of iodine $\mathrm{I}_{2}$, with hydrazine, $\mathrm{N}_{2} \mathrm{H}_{4}$, which has ammonia-like properties.

$$
\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+2 \mathrm{I}_{2}(\mathrm{aq}) \longrightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{HI}(\mathrm{~g})
$$

(i) During the preparation, gaseous hydrogen iodide produced must be removed immediately. Suggest a reason why this is done.
(ii) Hydrogen halides can be unstable to heat. Write an equation for the reaction undergone on heating hydrogen iodide, HI .
(iii) Using your knowledge of the chemistry of Group 17, deduce with reason how the thermal stability of hydrogen astatide, HAt, differ from that of hydrogen iodide, HI.
(d) A 40.0 g sample of solid ammonium carbonate is placed in a closed evacuated $3.0 \mathrm{dm}^{3}$ flask and heated to $400^{\circ} \mathrm{C}$. It decomposes to produce ammonia, water and carbon dioxide according to the equation :

$$
\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}(\mathrm{~s}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})
$$

The value of the equilibrium constant, $K_{\mathrm{p}}$, for the reaction is 0.295 at $400^{\circ} \mathrm{C}$.
In a gaseous reaction, the reactants and products can be expressed in partial pressures in atmospheres (atm). The relationship between $K_{\mathrm{c}}$ and $K_{\mathrm{p}}$ is given :

$$
K_{\mathrm{p}}=K_{\mathrm{c}}(\mathrm{RT})^{4}
$$

Assume that the gases are under ideal conditions.
(i) Write down the expression of $K_{p}$ for the above equilibrium system. Hence show that $K_{\mathrm{p}}=K_{\mathrm{c}}(\mathrm{RT})^{4}$.
(ii) Calculate the partial pressure of $\mathrm{NH}_{3}(\mathrm{~g})$ at equilibrium at $400^{\circ} \mathrm{C}$.
(iii) Calculate the total pressure inside the flask at equilibrium.
(iv) Calculate the mass of solid ammonium carbonate in the flask at equilibrium.
[Total: 18]

3 In chemistry, a conjugated system refers to a system of overlapping $p$ orbitals which allows the delocalisation of $\pi$ electrons in a molecule. It is represented by having alternating single and multiple bonds in the molecule.

1,3-butadiene is the simplest conjugated diene which has double bonds that is separated by a single bond. It is a colourless gas which is industrially important as a monomer in the production of synthetic rubber.

In general, conjugated dienes have similar chemical properties as the usual alkenes. However, they are associated with extra stability as the delocalisation of $\pi$ electrons lowers the overall energy of the molecule.
(a) The 2-step synthesis of butane shown in the figure below makes use of 1,3-butadiene as the intermediate.

(i) Given that compound $\mathbf{A}$ does not rotate plane polarised light, suggest a structure for it and state the type of reaction that takes place in step 1.
(ii) Write an equation to show the standard enthalpy change of hydrogenation, $\Delta H^{\ominus}{ }_{\text {hydrogenation }}$ of 1,3-butadiene in step 2.
(iii) A student calculated the expected $\Delta H^{0}$ hydrogenation of 1,3 -butadiene in step 2 to be $-252 \mathrm{~kJ} \mathrm{~mol}^{-1}$. However, 1,3-butadiene is $16 \mathrm{~kJ} \mathrm{~mol}^{-1}$ more stable than expected.

Calculate the actual $\Delta H^{\circ}$ hydrogenation of 1,3-butadiene.
(iv) Hence, using the value calculated in (iii) and the information given below, construct a fully labelled energy level diagram to determine the standard enthalpy change of combustion, $\Delta H^{\ominus}$ c of 1,3-butadiene.

| substance | $\Delta H^{\circ}{ }_{\mathrm{c}} / \mathrm{kJ} \mathrm{mol}^{-1}$ |
| :---: | :---: |
|  | -2877 |
| $\mathrm{H}_{2}$ | -286 |

(v) According to valence bond theory, the stability of conjugated diene could also be explained by orbital hybridisation.

By making reference to the $\mathrm{C}-\mathrm{C}$ single bond formed in 1,3-butadiene and butane, and the hybridisation of the orbitals in the two molecules, explain the extra stability of 1,3-butadiene.
(b) Conjugate dienes can undergo addition with alkenes in a process called Diels-Alder reaction to form cyclic products. It is an important synthetic method which is widely used in organic chemistry to form unsaturated cyclic products.

An example of the Diels-Alder reaction is shown below where 1,3-butadiene reacts with ethene to form cyclohexene.:

In the process, the two reactants react in a single step through a cyclic redistribution of bonding electrons and two new carbon-carbon bonds are formed at the same time.
(i) By using full-headed curly arrows, suggest the mechanism that takes place in the above reaction to form cyclohexene.
(ii) Compound $\mathbf{B}$ has the molecular formula of $\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{O}$ and it can be synthesised when 1,3-butadiene reacts with compound $\mathbf{C}, \mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}$, in the Diels-Alder reaction. It is known that compound $\mathbf{C}$ is able to react with 2 moles of hydrogen gas in the presence of Pt and produce a yellow precipitate with alkaline aqueous $\mathrm{I}_{2}$. Compound $\mathbf{C}$ also gives a positive test with 2,4 -dinitrophenylhydrazine and negative test with Tollens' reagent.

Suggest structures for compounds B and $\mathbf{C}$, and explain the reactions described.
(c) Compounds of aluminium such as aluminium oxide, $\mathrm{Al}_{2} \mathrm{O}_{3}$ and aluminium chloride, $\mathrm{AlCl}_{3}$ are often used in organic reactions as catalysts.
(i) Aluminium oxide has unique chemical properties as it is able to react with both acid and base.

Write balanced chemical equations for the reactions between aluminium oxide and the following respectively.

- HBr
- KOH
(ii) Account for the acid-base behaviour of aluminium oxide by making reference to its structure and bonding and state the nature of the oxide.

## Section B

Answer one question from this section.
4 (a) The Wittig reaction converts carbonyl compounds into alkenes by reacting aldehydes or ketones with alkyltriphenylphosphonium, such as methyltriphenylphosphonium.

Stage 1 - Preparation of methyltriphenylphosphonium

Stage 2 - Formation of alkene

Different alkenes can be formed by using different carbonyl compounds and R-groups on the alkyltriphenylphosphonium.
(i) The melting points of four compounds, including triphenylphosphine and methyltriphenylphosphonium bromide are given below.

| compound | formula | melting point $/{ }^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: |
| triphenylphosphine | $\mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3}$ | 80 |
| water | $\mathrm{H}_{2} \mathrm{O}$ | 0 |
| methyltriphenylphosphonium bromide | $\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3} \mathrm{P}=\mathrm{CH}_{2}{ }^{+} \mathrm{Br}$ | 232 |
| sodium chloride | NaCl | 801 |

With reference to their structure and bonding, suggest why the melting point of

1. triphenylphosphine is higher than water; and
2. methyltriphenylphosphonium bromide is lower than sodium chloride
(ii) State the type of reaction in step I.
(iii) State the role of $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3}{ }^{-} \mathrm{Li}^{+}$in step II.
(iv) The advantage of Wittig reaction is the predictability of its alkene product. It is used in industrial processes such as the formation on vitamin $A$.

Suggest the structures of alkylbromide $\mathbf{R}_{\mathbf{1}} \mathbf{- B r}$ and carbonyl compound $\mathbf{Z}$ for forming the derivative of vitamin A. You may assume that the OAc group remains unchanged during the reaction.
(b) Triphenylphosphine, $\mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3}$, is prepared by reacting phosphorus trichloride, chlorobenzene and sodium. Sodium chloride is precipitated during the reaction due to its insolubility in the organic mixture.
(i) Write the balanced equation for the preparation of triphenylphosphine.
(ii) Triphenylphosphine does not form in the above reaction when water is present. Given that phosphorus trichloride reacts with water according to this equation

$$
\mathrm{PCl}_{3}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{PO}_{3}+\mathrm{HCl}
$$

describe, with the aid of equation(s), any other reactions that will take place when water is used as a solvent. Hence or otherwise, suggest the colour of universal indicator in the resulting mixture.
(iii) It has been suggested that triphenylphosphine is a chiral compound. Two structures of triphenylphosphine are shown below.

State the relationship of the two structures and suggest why triphenylphosphine is a chiral compound.
(c) (i) The aqueous solutions of two acids were prepared and their pH measured.

| acid | concentration $/ \mathrm{mol} \mathrm{dm}^{-3}$ | pH |
| :---: | :---: | :---: |
| $\mathbf{M}$ | 0.75 | 1.11 |
| $\mathbf{N}$ | 0.25 | 0.60 |

Given that $\mathbf{M}$ and $\mathbf{N}$ are monobasic acids, show calculations to explain whether each acid is a strong or weak acid.
(ii) It is known that the electronegativity of the central atom in the acid affects its acidity.

With reference to the increasing trend of electronegativity across the period, suggest the correct identities of the acids $\mathbf{M}$ and $\mathbf{N}$, given that they could be $\mathrm{H}_{3} \mathrm{PO}_{2}$ or $\mathrm{HClO}_{3}$.

Use of the Data Booklet is relevant to this question.
Osmium is a bluish-white metal found as a trace element in alloys, mostly in platinum ores. Not surprisingly, osmium was discovered in 1803 by Smithson Tennant when he noticed a residue remaining after dissolving crude platinum in aqua regia - a mixture of concentrated nitric acid and concentrated hydrochloric acid.

Platinum reacts with concentrated nitric acid to produce aqueous platinum(IV) cations, nitrogen dioxide and water. The platinum(IV) cations are then complexed with chloride ligands to produce hexachloroplatinate(IV) anions which are recovered through the reaction with ammonium chloride to produce yellow crystals.
(a) (i) Define the term ligand.
(ii) Write a balanced ionic equation to represent the reaction of platinum with concentrated nitric acid.
(iii) Suggest the identity of the yellow crystals obtained.
(iv) The solubility of the yellow crystals in water at room temperature is $5.0 \mathrm{~g} \mathrm{dm}^{-3}$ but decreases to $0.028 \mathrm{~g} \mathrm{dm}^{-3}$ in $1 \mathrm{~mol} \mathrm{dm}^{-3}$ ammonium chloride at the same temperature.

Write an equation to represent the dissolution of the yellow crystals in (a)(iii) and use the equation to account for the decreased solubility in $1 \mathrm{~mol} \mathrm{dm}^{-3}$ ammonium chloride.
(v) Explain why hexachloroplatinate(IV) is coloured.

When powdered osmium is exposed to air, it forms the toxic compound osmium tetroxide, $\mathrm{OsO}_{4}$ with a strong odour like that of chlorine.

$$
\mathrm{Os}+2 \mathrm{O}_{2} \longrightarrow \mathrm{OsO}_{4}
$$

(b) (i) Use the standard electrode potential given and choose another appropriate equation from the Data Booklet to calculate the $E^{\circ}$ cell for the reaction between osmium and air.

$$
\mathrm{OsO}_{4}+8 \mathrm{H}^{+}+8 \mathrm{e}^{-} \rightleftharpoons \mathrm{Os}+4 \mathrm{H}_{2} \mathrm{O} \quad E^{\circ}=+0.84 \mathrm{~V}
$$

(ii) Hence calculate $\Delta G^{\ominus}{ }_{\text {cell }}$ for the reaction in (b)(i), leaving your answer in $\mathrm{kJ} \mathrm{mol}^{-1}$.
(iii) Suggest, with reasoning, the sign for the standard enthalpy change of reaction for the reaction between osmium and air, making reference to the terms in the Gibbs free energy equation and your answer in (b)(ii).

The figure below shows part of a label on a bottle of osmium tetroxide.

| Osmium Tetroxide, $\mathrm{OsO}_{4}$ |
| :--- |
| Molar mass: $254.2 \mathrm{~g} \mathrm{~mol}^{-1}$ |
| Density: 4.9 g cm |
| Vapour pressure: 933 Pa |
| Max. permissible exposure limit: $200 \mathrm{gg} \mathrm{m}^{-3}$ |
| Net weight: 1000 g |
| Volume of container: $250 \mathrm{~cm}^{3}$ |

Note:
Vapour pressure - the pressure of vapour in equilibrium with its solid/liquid form.
$1 \mu \mathrm{~g}=1 \times 10^{-6} \mathrm{~g}$
(c) (i) Use the information above to calculate the amount of $\mathrm{OsO}_{4}$ in the vapour phase within an unopened container of $\mathrm{OsO}_{4}$ at room temperature. Assume ideal gas behaviour.
(ii) Hence determine the concentration of $\mathrm{OsO}_{4}$, in $\mu \mathrm{g} \mathrm{m}^{-3}$, in the air of a $100 \mathrm{~m}^{3}$ laboratory where a new container is opened. Assume that the air has evenly mixed.
(iii) Discuss whether it is safe for researchers to open the container in this laboratory without a proper fume cupboard, considering your answer in (c)(ii) and the approach used to calculate it.

Osmium tetroxide, $\mathrm{OsO}_{4}$ can oxidise alkenes to give diols. $\mathrm{NaIO}_{4}$ will react further with the diol to produce carbonyl compounds.

(d) Suggest a simple chemical test to distinguish between compounds $\mathbf{A}$ and $\mathbf{B}$ and write a balanced equation for the positive test.
[Total: 20]

2 Recreational drugs like methamphetamine and methcathinone can be synthesised easily from pseudoephedrine, a common nasal decongestant found in cough medicine.

HI, followed by neutralisation
X
(a) (i) The structure of methcathinone and methamphetamine with $\mathrm{p} K_{\mathrm{b}}$ values at 298 K , are shown in the table below.
compound

Explain why methcathinone has a higher $\mathrm{p} K_{\mathrm{b}}$ value than methamphetamine.
Methcathinone is a weaker base (higher $\mathrm{p} K_{\mathrm{b}}$ ) as it has a carbonyl ( $\mathrm{C}=\mathrm{O}$ ) functional group two carbons away from secondary amine functional group, which is electron withdrawing. Hence the lone pair of electrons on $\mathbf{N}$ for methcathinone is less available for coordination with $\mathrm{H}^{+}$ion. (dative bonding with $\mathrm{H}^{+}$ion)

|  | The commercial preparation of hydrogen iodide, HI , involves the reaction of iodine $\mathrm{I}_{2}$, with hydrazine, $\mathrm{N}_{2} \mathrm{H}_{4}$, which has ammonia-like properties.$\mathrm{N}_{2} \mathrm{H}_{4}(\mathrm{I})+2 \mathrm{I}_{2}(\mathrm{aq}) \longrightarrow \mathrm{N}_{2}(\mathrm{~g})+4 \mathrm{HI}(\mathrm{~g})$ |  |
| :---: | :---: | :---: |
|  | (i) | During the preparation, gaseous hydrogen iodide produced must be removed immediately. Suggest a reason why this is done. |
|  |  | Hydrazine $\mathrm{N}_{2} \mathrm{H}_{4}$ is basic and it can react with HI (acidic) to form a salt $\mathrm{N}_{2} \mathrm{H}_{5}^{+} \mathrm{I}^{-}$ |
|  | (ii) | Hydrogen halides can be unstable to heat. Write an equation for the reaction undergone on heating hydrogen iodide, HI . |
|  |  | $\mathbf{2 H I} \longrightarrow \mathrm{H}_{2}+\mathrm{I}_{2}$ |
|  | (iii) | Using your knowledge of the chemistry of Group 17, deduce with reason how the thermal stability of hydrogen astatide, HAt, differ from that of hydrogen iodide, HI. |
|  |  | At is below I in Group 17 so it forms weaker covalent bond with hydrogen. As a result, HAt has lower thermal stability than HI. |
| (d) | A 40.0 g sample of solid ammonium carbonate is placed in a closed evacuated $3.0 \mathrm{dm}^{3}$ flask and heated to $400^{\circ} \mathrm{C}$. It decomposes to produce ammonia, water and carbon dioxide according to the equation : $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}(\mathrm{~s}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g})$ <br> The value of the equilibrium constant, $K_{\mathrm{p}}$, for the reaction is 0.295 at $400^{\circ} \mathrm{C}$. <br> In a gaseous reaction, the reactants and products can be expressed in partial pressures in atmospheres (atm). The relationship between $K_{\mathrm{c}}$ and $K_{\mathrm{p}}$ is given : $K_{\mathrm{p}}=K_{\mathrm{c}}(\mathrm{RT})^{4}$ <br> Assume that the gases are under ideal conditions. |  |
|  | (i) | Write down the expression of $K_{p}$ for the above equilibrium system. Hence show that $K_{\mathrm{p}}=K_{\mathrm{c}}(\mathrm{RT})^{4}$. |
|  |  | $\begin{aligned} & K_{\mathrm{p}}=\left(\mathrm{P}_{\mathrm{NH} 3}\right)^{2}\left(\mathrm{P}_{\mathrm{H} 2 \mathrm{O})}\right)\left(\mathrm{P}_{\mathrm{co} 2}\right) \\ & \text { Using } \mathrm{pV}=\mathrm{nRT} \\ & \quad \mathrm{P}=(\mathrm{n} / \mathrm{V}) \mathrm{RT}=\mathrm{CRT} \\ & \begin{aligned} K_{\mathrm{p}} & =\left(\left[\mathrm{NH}_{3}\right] \mathrm{RT}^{2}\right)^{2}\left(\left[\mathrm{H}_{2} \mathrm{O}\right] \mathrm{RT}\right)\left(\left[\mathrm{CO}_{2}\right] \mathrm{RT}\right) \\ & =\left[\mathrm{NH}_{3}\right]^{2}\left[\mathrm{H}_{2} \mathrm{O}\right]\left[\mathrm{CO}_{2}\right](\mathrm{RT})^{4} \\ & =K_{\mathrm{c}}\left(\mathrm{RTT}^{4}\right)^{4} \end{aligned} \end{aligned}$ |
|  | (ii) | Calculate the partial pressure of $\mathrm{NH}_{3}(\mathrm{~g})$ at equilibrium at $400^{\circ} \mathrm{C}$. [2] |

| 3 | In chemistry, a conjugated system refers to a system of overlapping p orbitals which allows the delocalisation of $\pi$ electrons in a molecule. It is represented by having alternating single and multiple bonds in the molecule. <br> 1,3-butadiene is the simplest conjugated diene which has double bonds that is separated by a single bond. It is a colourless gas which is industrially important as a monomer in the production of synthetic rubber. <br> In general, conjugated dienes have similar chemical properties as the usual alkenes. However, they are associated with extra stability as the delocalisation of $\pi$ electrons lowers the overall energy of the molecule. |  |
| :---: | :---: | :---: |
|  | (a) $\begin{aligned} & \text { The } \\ & \text { as th } \\ & \text { Com }\end{aligned}$ | 2-step synthesis of butane shown in the figure below makes use of 1,3-butadiene e intermediate. |
|  | (i) | Given that compound $\mathbf{A}$ does not rotate plane polarised light, suggest a structure for it and state the type of reaction that takes place in step 1. <br> Elimination <br> Alternative answer: |
|  | (ii) | Write an equation to show the standard enthalpy change of hydrogenation, $\Delta H^{9}$ hydrogenation of 1,3-butadiene in step 2. <br> (g) $+2 \mathrm{H}_{2}(\mathrm{~g}) \longrightarrow$  (g) |
|  | (iii) | A student calculated the expected $\Delta H^{\ominus}{ }_{\text {hydrogenation }}$ of 1,3-butadiene in step 2 to be $-252 \mathrm{~kJ} \mathrm{~mol}^{-1}$. However, 1,3 -butadiene is $16 \mathrm{~kJ} \mathrm{~mol}^{-1}$ more stable than expected. <br> Calculate the actual $\Delta H^{\ominus}$ hydrogenation of 1,3-butadiene. <br> Actual $\Delta H^{\circ}{ }_{\text {hydrogenation }}$ of 1,3-butadiene $=-252+16=-236 \mathrm{~kJ} \mathrm{~mol}^{-1}$ |

| :---: | :---: | :---: | :---: |
| (c) | Compounds of aluminium such as aluminium oxide, $\mathrm{Al}_{2} \mathrm{O}_{3}$ and aluminium chloride, $\mathrm{AlCl}_{3}$ are often used in organic reactions as catalysts. |  |  |
|  | (i) | Aluminium oxide has uniqu acid and base. <br> Write balanced chemical eq and the following respective <br> - HBr <br> - KOH $\begin{aligned} & \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})+6 \mathrm{HBr}(\mathrm{aq}) \\ & \mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s})+2 \mathrm{KOH}(\mathrm{aq})+3 \end{aligned}$ | hemical properties as it is able to react with both <br> tions for the reactions between aluminium oxide $\begin{aligned} & 2 \mathrm{AlBr}_{3}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\ & \mathrm{O}(\mathrm{I}) \\ & 2 \mathrm{~K}\left[\mathrm{~A} /(\mathrm{OH})_{4}\right](\mathrm{aq}) \end{aligned}$ |
|  | (ii) | Account for the acid-base be its structure and bonding and <br> Aluminium oxide has a electrostatic forces of attra to the high charge density character in the compound which can react with both | aviour of aluminium oxide by making reference to state the nature of the oxide. <br> giant ionic lattice structure with strong tion between $\mathrm{Al}^{3+}$ and $\mathrm{O}^{2-}$ ions. However, due of the $A{ }^{3+}$ ion, there is considerable covalent hence resulting it being an amphoteric oxide ids and alkalis. |

## Section B

Answer one question from this section.

| 4 | (a) | The Wittig reaction converts carbonyl compounds into alkenes by reacting aldehydes or |
| :--- | :--- | :--- | ketones with alkyltriphenylphosphonium, such as methyltriphenylphosphonium. During the reaction, the number of carbon atoms also increases.

## Stage 1 - Preparation of methyltriphenylphosphonium

triphenylphosphine

methyltriphenylphosphonium

Stage 2 - Formation of alkene

Different alkenes can be formed by using different carbonyl compounds and R-groups on the alkyltriphenylphosphonium.
(i) The melting points of four compounds are given below.

| compound | formula | melting point $/{ }^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: |
| triphenylphosphine | $\mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3}$ | 80 |
| water | $\mathrm{H}_{2} \mathrm{O}$ | 0 |
| methyltriphenylphosphonium bromide | $\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3} \mathrm{P}=\mathrm{CH}_{2}{ }^{+} \mathrm{Br}^{-}$ | 232 |
| sodium chloride | NaCl | 801 |

With reference to their structure and bonding, suggest why the melting point of

1. triphenylphosphine is higher than water; and
2. methyltriphenylphosphonium bromide is lower than sodium chloride

|  |  | 1. Both compounds have simple molecular structures with weak intermolecular forces of attraction between their molecules. Triphenylphosphine has larger and more polarizable electron cloud than water. Thus is has stronger instantaneous dipole-induced dipole interaction than (the hydrogen bonding of) water. <br> 2. Both compounds have giant ionic lattice structures. Methyltriphenylphosphonium bromide has ions with larger radii than NaCl , hence lattice energy is less exothermic and melting point is lower. |
| :---: | :---: | :---: |
|  | (ii) | State the type of reaction in step I. [1] |
|  |  | Nucleophilic substitution or $\mathrm{S}_{\mathbf{N}} 2$ |
|  | (iii) | State the role of $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3}-\mathrm{Li}+$ in Step II. |
|  |  | Base |
|  | (iv) | The advantage of Wittig reaction is the predictability of its alkene product. It is used in industrial processes such as the formation on vitamin $A$. <br> Suggest the structures of alkylbromide $\mathbf{R}_{\mathbf{1}} \mathbf{- B r}$ and carbonyl compound $\mathbf{Z}$ for forming the derivative of vitamin A. You may assume that the OAc group remains unchanged during the reaction. |
|  |  |   |
| (b) |  | enylphosphine, $\mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3}$, is prepared by reacting phosphorus trichloride, abenzene and sodium. Sodium chloride is precipitated during the reaction due to its ubility in the organic mixture. |
|  | (i) | Write the balanced equation for the preparation of triphenylphosphine. [1] |
|  |  | $\mathrm{PCl}_{3}+3 \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{Cl}+6 \mathrm{Na} \longrightarrow \mathrm{P}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{3}+6 \mathrm{NaCl}$ |

Given that $\mathbf{M}$ and $\mathbf{N}$ are monobasic acids, show calculations to explain whether each acid is a strong or weak acid.

To determine if acid $\mathbf{M}$ dissociates fully:
$-\log (0.75)=0.125$
Since pH is higher than $0.125, \mathrm{M}$ did not dissociate fully. M is a weak acid.
To determine if acid $\mathbf{N}$ dissociates fully:
$-\log (0.25)=0.60$

|  |  | Since $\mathbf{p H}$ is $\mathbf{0 . 6 0 , ~} \mathbf{N}$ dissociated fully. $\mathbf{N}$ is a strong acid. |
| :---: | :---: | :---: |
|  | (ii) | It is known that the electronegativity of the central atom in the acid affects its acidity. <br> With reference to the increasing trend of electronegativity across the period, suggest the correct identities of the acids $\mathbf{M}$ and $\mathbf{N}$, given that they could be $\mathrm{H}_{3} \mathrm{PO}_{2}$ or $\mathrm{HClO}_{3}$. |
|  |  | $M$ is $\mathrm{H}_{3} \mathrm{PO}_{2}$ and N is $\mathrm{HClO}_{3}$. <br> Cl atom is more electronegative than P , so it polarizes the $\mathrm{O}-\mathrm{H}$ bond in $\mathrm{HClO}_{3}$ to a greater extent, causing $\mathrm{H}^{+}$ion to be given off more readily, hence $\mathrm{HClO}_{3}$ is a stronger acid, and must be $\mathbf{N}$. <br> OR <br> Cl atom is more electronegative than P , so it disperses the negative charge on the conjugate base, $\mathrm{ClO}_{3}{ }^{-}$, to a greater extent. As the conjugate base is more stabilized, the acid is a stronger one. |
|  |  | [Total: 20] |

5 Use of the Data Booklet is relevant to this question.
Osmium is a bluish-white metal found as a trace element in alloys, mostly in platinum ores. Not surprisingly, osmium was discovered in 1803 by Smithson Tennant when he noticed a residue remaining after dissolving crude platinum in aqua regia - a mixture of concentrated nitric acid and concentrated hydrochloric acid.

Platinum reacts with concentrated nitric acid to produce aqueous platinum(IV) cations, nitrogen dioxide and water. The platinum(IV) cations are then complexed with chloride ligands to produce hexachloroplatinate(IV) anions which are recovered through the reaction with ammonium chloride to produce yellow crystals.

| (a) | (i) | Define the term ligand. <br> A ligand is a neutral molecule or anion with at least one atom bearing a lone pair of electrons capable of dative bonding/coordinating to the central metal atom or ion. |
| :---: | :---: | :---: |
|  | (ii) | Write a balanced ionic equation to represent the reaction of platinum with concentrated nitric acid. $\mathrm{Pt}+8 \mathrm{HNO}_{3} \longrightarrow \mathrm{Pt}^{4+}+4 \mathrm{NO}_{2}+4 \mathrm{NO}_{3}^{-}+4 \mathrm{H}_{2} \mathrm{O}$ |
|  | (iii) | Suggest the identity of the yellow crystals obtained. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{PtCl}_{6}$ |
|  | (iv) | The solubility of the yellow crystals in water at room temperature is $5.0 \mathrm{~g} \mathrm{dm}^{-3}$ but decreases to $0.028 \mathrm{~g} \mathrm{dm}^{-3}$ in $1 \mathrm{~mol} \mathrm{dm}^{-3}$ ammonium chloride at the same temperature. <br> Write an equation to represent the dissolution of the yellow crystals in in (a)(iii) and use the equation to account for the decreased solubility in $1 \mathrm{~mol} \mathrm{dm}^{-3}$ ammonium chloride. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{PtCl}_{6}(\mathrm{~s}) \rightleftharpoons 2 \mathrm{NH}_{4}^{+}(\mathrm{aq})+\mathrm{PtCl}_{6}{ }^{2-}(\mathrm{aq})$ <br> The solubility of the yellow crystals will be reduced as the position of equilibrium in the solubility equilibria is pushed back to the left due to the common ion effect brought about by $\mathrm{NH}_{4}{ }^{+}$. |
|  | (v) | Explain why hexachloroplatinate(IV) is coloured. <br> When chloride ligands approach the $\mathrm{Pt}^{4+}$ central cation, the degenerate d-orbitals/d-subshell split into two groups of different energy levels. An electron in the lower level can absorb energy equivalent to the energy gap which corresponds to a certain wavelength of light from the visible region of the electromagnetic spectrum and be promoted to the higher energy level. The colour seen is complementary to the colour absorbed. |

| (c) | (i) | Use the information above to calculate the amount of $\mathrm{OsO}_{4}$ in the vapour phase within an unopened container of $\mathrm{OsO}_{4}$ at room temperature. Assume ideal gas behaviour. $\begin{aligned} & \text { Gas volume }=250-\frac{1000}{4.9}=45.9 \mathrm{~cm}^{3} \\ & n\left(\mathrm{OsO}_{4} \text { vapour }\right)=\frac{p V}{R T}=\frac{933 \times \frac{45.9}{1000000}}{8.31 \times 293}=1.76 \times 10^{-5} \mathrm{~mol} \end{aligned}$ |
| :---: | :---: | :---: |
|  | (ii) | Hence determine the concentration of $\mathrm{OsO}_{4}$, in $\mu \mathrm{g} \mathrm{m}{ }^{-3}$, in the air of a $100 \mathrm{~m}^{3}$ laboratory where a new container is opened. Assume that the air has evenly mixed. $\begin{aligned} & \mathrm{m}\left(\mathrm{OsO}_{4} \text { vapour }\right)=1.76 \times 10^{-5} \times 254.2=4.47 \times 10^{-3} \mathrm{~g} \\ & {\left[\mathrm{OsO}_{4}\right]=\frac{4.47 \times 10^{-3}}{100}=4.47 \times 10^{-5} \mathrm{~g} \mathrm{~m}^{-3}=44.7 \mu \mathrm{~g} \mathrm{~m}^{-3}} \end{aligned}$ |
|  | (iii) | Discuss whether it is safe for researchers to open the container in this laboratory without a proper fume cupboard, considering your answer in (c)(ii) and the approach used to calculate it. <br> Yes, since the effective concentration of $44.7 \mu \mathrm{~g} \mathrm{~m}^{-3}$ is less than the maximum permissible exposure limit of $200 \mu \mathrm{~g} \mathrm{~m}{ }^{-3}$. <br> OR <br> No, it is not safe as the vapour takes time to diffuse evenly throughout the room. The immediate air around the researchers will have a concentration of $\mathrm{OsO}_{4}$ exceeding the maximum permissible limit. |
| Osmium tetroxide, $\mathrm{OsO}_{4}$ can oxidise alkenes to give diols. $\mathrm{NaIO}_{4}$ will react further with the diol to produce carbonyl compounds. |  |  |
| (d) |  | gest a simple chemical test to distinguish between compounds $\mathbf{A}$ and $\mathbf{B}$ and write a nced equation for the positive test. <br> NPH, room conditions w crystals formed with B but no yellow crystals formed with $\mathbf{A}$. |

|  | OR <br> Tollens' reagent, warm <br> Silver mirror formed with $\mathbf{B}$ but no silver mirror formed with $\mathbf{A}$. $\mathrm{CH}_{3} \mathrm{CHO}+2\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+3 \mathrm{OH}^{-} \rightarrow 2 \mathrm{Ag}+4 \mathrm{NH}_{3}+\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}+2 \mathrm{H}_{2} \mathrm{O}$ <br> OR <br> Fehling's reagent, warm <br> Red-brown ppt formed with $\mathbf{B}$ but no red-brown ppt formed with $\mathbf{A}$. $\mathrm{CH}_{3} \mathrm{CHO}+2 \mathrm{Cu}^{2+}+5 \mathrm{OH}^{-} \rightarrow \mathrm{CH}_{3} \mathrm{CO}_{2}^{-}+\mathrm{Cu}_{2} \mathrm{O}+3 \mathrm{H}_{2} \mathrm{O}$ <br> OR <br> Sodium, room conditions <br> Effervescence observed with A. Gas evolved extinguishes lighted splint with a pop sound. No effervescence observed with B. <br> OR <br> $\mathrm{PCl}_{5}$, room conditions <br> Steamy/White fumes observed with $\mathbf{A}$ but no white fumes observed with $\mathbf{B}$. $\mathrm{CH}_{2}(\mathrm{OH}) \mathrm{CH}_{2} \mathrm{OH}+2 \mathrm{PCl}_{5} \rightarrow \mathrm{CH}_{2} \mathrm{ClCH}_{2} \mathrm{Cl}+2 \mathrm{POCl}_{3}+2 \mathrm{HCl}$ <br> OR <br> $\mathrm{SOCl}_{2}$ (pyridine), heat <br> Steamy/White fumes observed with $\mathbf{A}$ but no white fumes observed with B. $\mathrm{CH}_{2}(\mathrm{OH}) \mathrm{CH}_{2} \mathrm{OH}+2 \mathrm{SOCl}_{2} \rightarrow \mathrm{CH}_{2} \mathrm{ClCH}_{2} \mathrm{Cl}+2 \mathrm{HCl}+2 \mathrm{SO}_{2}$ |
